## StoreFront 3.12

October 15, 2018

StoreFront manages the delivery of desktops and applications from XenApp and XenDesktop servers, and XenMobile servers in the data center to user devices. StoreFront enumerates and aggregates available desktops and applications into stores. Users access StoreFront stores through Citrix Receiver directly or by browsing to a Citrix Receiver for Web or Desktop Appliance site. Users can also access StoreFront using thin clients and other end-user-compatible devices through a XenApp Services site.

StoreFront keeps a record of each user's applications and automatically updates their devices. Users have a consistent experience as they roam between their smartphones, tablets, laptops, and desktop computers. StoreFront is an integral component of XenApp 7.x and XenDesktop 7.x but can be used with several versions of XenApp and XenDesktop.

### About this documentation

Documentation for this product version is not the latest version. For the most recently updated content, see the [StoreFront](#) current release documentation. This documentation is provided in HTML format and as the following PDF.

[StoreFront 3.12](#) (PDF Download)

**Note:**

Links to external websites found in the PDF above take you to the correct pages, but links to other sections within the PDF are no longer usable.

## About StoreFront

October 25, 2018

### What's new in StoreFront

StoreFront 3.12 includes a number of [fixed issues](#) and [known issues](#).

**Integrate Citrix Online applications with stores.** We made a [deprecation](#) announcement for this feature in XenApp and XenDesktop 7.14 (StoreFront 3.11). In 3.12, this feature cannot be configured in the StoreFront management console. If you upgrade to StoreFront 3.12, you can continue to use this feature. To change your configuration, use the PowerShell cmdlet, Update-DSGenericApplications. For more information, see [Integrate Citrix Online applications with stores](#).

## Fixed issues

September 9, 2020

The following issues have been fixed since version 3.11:

- If the Administrator changes the group policy setting, MaxPasswordAge, the StoreFront default domain service does not reload the new value. In StoreFront, the user may be shown the incorrect “number of days until password expiry”.

**Note:** This issue is fixed, however it can take up to an hour for the new value to load. [#DNA-41380]

- Attempts to reconnect to disconnected sessions might fail within a multi-Site aggregation deployment. As a result, you might receive a second instance of the same resource. [#LC7453]
- When any of the sources of an aggregated application are disabled, the application might be unexpectedly hidden from the end user. [#LC7675]
- Attempts to disable the “Account Self-Service” option in StoreFront might not take effect, even though the option appears as disabled. [#LC7744]
- Attempts to remove shared authentication from Stores in StoreFront might result in the following error message while saving the changes:  
*An error occurred while saving your changes.* [#LC7781]
- This release contains a fix which addresses a security vulnerability. For more information, see Knowledge Center article [CTX277455](#). [LCM-7272]

## Known issues

October 15, 2018

The following issues are known to exist in this release.

- The StoreFront management console does not open after an upgrade to StoreFront 3.12.1000 (XenApp and XenDesktop 7.15 LTSR CU1) from StoreFront 3.12 (XenApp and XenDesktop 7.15 LTSR), or after an install of StoreFront 3.12.1000. The StoreFront management console displays the error “MMC could not create the snap-in. The snap-in might not have been installed correctly.” To work around this issue, follow the steps described in [CTX233206](#).

[# LC8935]

- Workspace control reconnects to only one app session instead of all the apps in the workspace. This issue is seen if using Chrome to access the Receiver for Web site. To work around this issue, click Connect on each disconnected app.

[# DNA-25140]

- If a custom authentication form contains an element with ID=confirmBtn, users cannot log on to Citrix Receiver for Web. To work around this issue, the authentication extension should use a different ID value in the custom form.

[# 603196, DNA-22593]

- Reconnecting apps in the Chrome browser might fail. If you reconnect to published applications and more than one session is in use, clicking **Connect** might only reconnect the first session. To work around this issue, click **Connect** again to reconnect each additional session.

[# 575364, DNA-22561]

## Third party notices

October 15, 2018

StoreFront might include third party software licensed under the terms defined in the following document:

[StoreFront Third Party Notices](#) (PDF Download)

## System requirements

November 4, 2021

When planning your installation, Citrix recommends that you allow at least an additional 2 GB of RAM for StoreFront over and above the requirements of any other products installed on the server. The subscription store service requires a minimum of 5 MB disk space, plus approximately 8 MB for every 1000 application subscriptions. All other hardware specifications must meet the minimum requirements for the installed operating system.

Citrix has tested and provides support for StoreFront installations on the following platforms:

- Windows Server 2016 Datacenter and Standard editions
- Windows Server 2012 R2 Datacenter and Standard editions
- Windows Server 2012 Datacenter and Standard editions
- Windows Server 2008 R2 Service Pack 1 Enterprise and Standard editions

Upgrading the operating system version on a server running StoreFront is not supported. Citrix recommends that you install StoreFront on a new installation of the operating system. All the servers in a multiple server deployment must run the same operating system version with the same locale settings.

StoreFront server groups containing mixtures of operating system versions and locales are not supported. StoreFront server groups can contain a maximum of six servers. However, from a capacity perspective based on simulations, there is no advantage of server groups containing more than three servers. Ideally, all servers in a server group should reside in the same location (data center, availability zone), but server groups can span locations within the same region provided that links between servers in the group meet minimum latency criteria. See [Scalability](#).

Microsoft Internet Information Services (IIS) and Microsoft .NET Framework are required on the server. If either of these prerequisites is installed but not enabled, the StoreFront installer enables them before installing the product. Windows PowerShell and Microsoft Management Console, which are both default components of Windows Server, must be installed on the web server before you can install StoreFront. The relative path to StoreFront in IIS must be the same on all the servers in a group.

The StoreFront installer will add the IIS features it requires. If you pre-install these features, below is the required list:

On all platforms:

- Web-Static-Content
- Web-Default-Doc
- Web-Http-Errors
- Web-Http-Redirect
- Web-Http-Logging
- Web-Mgmt-Console
- Web-Scripting-Tools
- Web-Windows-Auth
- Web-Basic-Auth
- Web-AppInit

On Windows Server 2008 R2:

- Web-Asp-Net
- As-Tcp-PortSharing

On Windows Server 2012 R2:

- Web-Asp-Net45
- Net-Wcf-Tcp-PortSharing45

On Windows Server 2016

- Web-Asp-Net45

- Net-Wcf-Tcp-PortSharing45

StoreFront uses the following ports for communications. Ensure your firewalls and other network devices permit access to these ports.

- TCP ports 80 and 443 are used for HTTP and HTTPS communications, respectively, and must be accessible from both inside and outside the corporate network.
- TCP port 808 is used for communications between StoreFront servers and must be accessible from inside the corporate network.
- A TCP port randomly selected from all unreserved ports is used for communications between the StoreFront servers in a server group. When you install StoreFront, a Windows Firewall rule is configured enabling access to the StoreFront executable. However, since the port is assigned randomly, you must ensure that any firewalls or other devices on your internal network do not block traffic to any of the unassigned TCP ports.
- TCP port 8008 is used by Citrix Receiver for HTML5, where enabled, for communications from local users on the internal network to the servers providing their desktops and applications.

StoreFront supports both pure IPv6 networks and dual-stack IPv4/IPv6 environments.

## **Infrastructure requirements**

Citrix has tested and provides support for StoreFront when used with the following Citrix product versions.

### **Citrix server requirements**

StoreFront stores aggregate desktops and applications from the following products.

- XenApp and XenDesktop 7.15
- XenApp and XenDesktop 7.14
- XenApp and XenDesktop 7.13
- XenApp and XenDesktop 7.12
- XenApp and XenDesktop 7.11
- XenApp and XenDesktop 7.9
- XenApp and XenDesktop 7.8
- XenApp and XenDesktop 7.7
- XenApp and XenDesktop 7.6
- XenApp and XenDesktop 7.5
- XenDesktop 7.1
- XenDesktop 7
- XenApp 6.5
- XenMobile 9.0 or App Controller 9.0

### **NetScaler Gateway requirements**

The following versions of NetScaler Gateway can be used to provide access to StoreFront for users on public networks.

- Citrix Gateway 12.x
- NetScaler Gateway 12.0
- NetScaler Gateway 11.x
- NetScaler Gateway 10.5
- NetScaler Gateway 10.1
- Access Gateway 10 Build 69.4 (the version number is displayed at the top of the configuration utility)

### **Citrix Receiver for HTML5 requirements**

If you plan to enable users to access desktops and applications using Citrix Receiver for HTML5 running on Receiver for Web sites, the following additional requirements apply.

For internal network connections, Citrix Receiver for HTML5 enables access to desktops and applications provided by the following products.

- XenApp and XenDesktop 7.15
- XenApp and XenDesktop 7.14
- XenApp and XenDesktop 7.13
- XenApp and XenDesktop 7.12
- XenApp and XenDesktop 7.11
- XenApp and XenDesktop 7.9
- XenApp and XenDesktop 7.8
- XenApp and XenDesktop 7.7
- XenApp and XenDesktop 7.6
- XenApp and XenDesktop 7.5
- XenDesktop 7.1
- XenDesktop 7
- XenApp 6.5 Feature Pack 2
- XenApp 6.5 Feature Pack 1 for Windows Server 2008 R2 (requires Hotfix XA650R01W2K8R2X64051, which is available at <http://support.citrix.com/article/CTX135757>)

For remote users outside the corporate network, Citrix Receiver for HTML5 enables access to desktops and applications through the following versions of NetScaler Gateway.

- Citrix Gateway 12.x
- NetScaler Gateway 12.0
- NetScaler Gateway 11.x

- NetScaler Gateway 10.1
- Access Gateway 10 Build 71.6014 (the version number is displayed at the top of the configuration utility)

For users connecting through NetScaler Gateway, Citrix Receiver for HTML5 enables access to desktops and applications provided by the following products.

- XenApp and XenDesktop 7.15
- XenApp and XenDesktop 7.14
- XenApp and XenDesktop 7.13
- XenApp and XenDesktop 7.12
- XenApp and XenDesktop 7.11
- XenApp and XenDesktop 7.9
- XenApp and XenDesktop 7.8
- XenApp and XenDesktop 7.7
- XenApp and XenDesktop 7.6
- XenApp and XenDesktop 7.5
- XenDesktop 7.1
- XenDesktop 7
- XenApp 6.5

## **User device requirements**

StoreFront provides a number of different options for users to access their desktops and applications. Citrix Receiver users can either access stores through Citrix Receiver or use a web browser to log on to a Citrix Receiver for Web site for the store. For users who cannot install Citrix Receiver, but have an HTML5-compatible web browser, you can provide access to desktops and applications directly within the web browser by enabling Citrix Receiver for HTML5 on your Citrix Receiver for Web site.

Users with non-domain-joined desktop appliances access their desktops through their web browsers, which are configured to access Desktop Appliance sites. In the case of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with older Citrix clients that cannot be upgraded, users must connect through the XenApp Services URL for the store.

If you plan to deliver offline applications to users, the Offline Plug-in is required in addition to Citrix Receiver for Windows. If you want to deliver Microsoft Application Virtualization (App-V) sequences to users, a supported version of the Microsoft Application Virtualization Desktop Client is also required. For more information, see [Managing Streamed Applications](#). Users cannot access offline applications or App-V sequences through Citrix Receiver for Web sites.

It is assumed that all user devices meet the minimum hardware requirements for the installed operating system.

### **Requirements for Citrix Receiver-enabled stores**

The following Citrix Receiver versions can be used to access StoreFront stores from both internal network connections and through NetScaler Gateway. Connections through NetScaler Gateway can be made using both the NetScaler Gateway Plug-in and/or clientless access. Citrix Receiver for Windows 4.3 is the minimum version required to receive the full StoreFront unified Citrix Receiver experience. See [Support for the unified Citrix Receiver experience](#).

- [Citrix Receiver for Chrome 2.x](#)
- [Citrix Receiver for HTML5 2.x](#)
- [Citrix Receiver for Mac 12.x](#)
- [Citrix Receiver for Windows 4.x](#)
- [Citrix Receiver for Linux 13.x](#)

### **Requirements for access to stores through Citrix Receiver for Web sites**

To access Citrix Receiver for Web sites from both internal network connections and through Citrix Gateway, use latest version of the following browsers:

#### **On Windows**

- Internet Explorer 11
- MS Edge (based on Chromium)\*
- Google Chrome
- Mozilla Firefox

\* Microsoft Edge (based on Chromium) is supported on Windows 10 only.

#### **Note:**

Citrix support is dependent on the official Microsoft support/extended support for the underlying OS and browser versions running on those OSs.

#### **On Mac**

- Safari
- Google Chrome
- Mozilla Firefox

#### **On Linux**

- Google Chrome
- Mozilla Firefox

Connections through Citrix Gateway can be made using the Citrix Gateway plug-in, ICA proxy or client-less VPN (cVPN). Additionally, specific versions of Citrix Gateway are required to enable connections from outside the corporate network. For more information, see [Infrastructure requirements](#).

### **Requirements for access to desktops and applications through Receiver for HTML5**

The following operating systems and web browsers are recommended for users to access desktops and applications using Receiver for HTML5 running on Receiver for Web sites. Both internal network connections and connections through NetScaler Gateway are supported. However, for connections from the internal network, Receiver for HTML5 only enables access to resources provided by specific products. Additionally, specific versions of NetScaler Gateway are required to enable connections from outside the corporate network. For more information, see [Infrastructure requirements](#).

- Browsers
  - Microsoft Edge Legacy
  - Internet Explorer 11 and 10 (HTTP connections only)
  - Safari 7
  - Safari 6
  - Google Chrome
  - Mozilla Firefox
- Operating systems
  - Windows RT
  - Windows 10 (32-bit and 64-bit editions)
  - Windows 8.1 (32-bit and 64-bit editions)
  - Windows 8 (32-bit and 64-bit editions)
  - Windows 7 Service Pack 1 (32-bit and 64-bit editions)
  - Windows Vista Service Pack 2 (32-bit and 64-bit editions)
  - Windows Embedded XP
  - Mac OS X 10.10 Yosemite
  - Mac OS X 10.9 Mavericks
  - Mac OS X 10.8 Mountain Lion
  - Mac OS X 10.7 Lion
  - Mac OS X 10.6 Snow Leopard
  - Google Chrome OS 48
  - Google Chrome OS 47
  - Ubuntu 12.04 (32-bit)

### **Requirements for access to stores through Desktop Appliance sites**

The following Citrix Receiver, operating system, and web browser combinations are recommended for users to access Desktop Appliance sites from the internal network. Connections through NetScaler

Gateway are not supported.

- Citrix Receiver for Windows 4.5, Citrix Receiver for Windows 4.4, Citrix Receiver for Windows 4.3, and Citrix Receiver for Windows 4.2.x, and Citrix Receiver for Windows 4.1
  - Windows 8.1 (32-bit and 64-bit editions)
    - \* Internet Explorer 11 (32-bit mode)
  - Windows 8 (32-bit and 64-bit editions)
    - \* Internet Explorer 10 (32-bit mode)
  - Windows 7 Service Pack 1 (32-bit and 64-bit editions), Windows Embedded Standard 7 Service Pack 1, or Windows Thin PC
    - \* Internet Explorer 9 (32-bit mode)
    - \* Internet Explorer 8 (32-bit mode)
  - Windows Embedded XP
    - \* Internet Explorer 8 (32-bit mode)
- Citrix Receiver for Windows 4.0 or Citrix Receiver for Windows 3.4
  - Windows 8 (32-bit and 64-bit editions)
    - \* Internet Explorer 10 (32-bit mode)
  - Windows 7 Service Pack 1 (32-bit and 64-bit editions), Windows Embedded Standard 7 Service Pack 1, or Windows Thin PC
    - \* Internet Explorer 9 (32-bit mode)
    - \* Internet Explorer 8 (32-bit mode)
  - Windows Embedded XP
    - \* Internet Explorer 8 (32-bit mode)
- Citrix Receiver for Windows Enterprise 3.4
  - Windows 7 Service Pack 1 (32-bit and 64-bit editions), Windows Embedded Standard 7 Service Pack 1, or Windows Thin PC
    - \* Internet Explorer 9 (32-bit mode)
    - \* Internet Explorer 8 (32-bit mode)
  - Windows Embedded XP
    - \* Internet Explorer 8 (32-bit mode)
- Citrix Receiver for Linux 12.1
  - Ubuntu 12.04 (32-bit)
    - \* Mozilla Firefox 27

### **Requirements for access to stores through XenApp Services URLs**

All the versions of Citrix Receiver listed above can be used to access StoreFront stores with reduced functionality through XenApp Services URLs. In addition, you can use the older client that does not support other access methods - Citrix Receiver for Linux 12.0 (internal network connections only) - to access stores through XenApp Services URLs. Connections through NetScaler Gateway, where sup-

ported, can be made using both the NetScaler Gateway Plug-in and clientless access.

## **Smart card requirements**

### **Requirement for using Citrix Receiver for Windows 4.X with smart cards**

Citrix tests for compatibility with the U.S. Government Dept. Of Defense Common Access Card (CAC), U.S. National Institute of Standards and Technology Personal Identity Verification (NIST PIV) cards, and some USB smart card tokens. You can use contact card readers that comply with the USB Chip/Smart Card Interface Devices (CCID) specification and are classified by the German Zentraler Kreditausschuss (ZKA) as Class 1 smart card readers. ZKA Class 1 contact card readers require that users insert their smart cards into the reader. Other types of smart card readers, including Class 2 readers (which have keypads for entering PINs), contactless readers, and virtual smart cards based on Trusted Platform Module (TPM) chips, are not supported.

For Windows devices, smart card support is based on Microsoft Personal Computer/Smart Card (PC/SC) standard specifications. As a minimum requirement, smart cards and card readers must be supported by the operating system and have received Windows Hardware Certification.

For more information about Citrix-compatible smart cards and middleware, see [Smart cards](#) in the XenApp and XenDesktop documentation, and <http://www.citrix.com/ready>.

### **Requirements for using Desktop Appliance sites with smart cards**

For users with desktop appliances and repurposed PCs running the Citrix Desktop Lock, Citrix Receiver for Windows Enterprise 3.4 is required for smart card authentication. On all other Windows devices, Citrix Receiver for Windows 4.1 can be used.

### **Requirements for authentication through NetScaler Gateway**

The following versions of NetScaler Gateway can be used to provide access to StoreFront for users on public networks authenticating with smart cards.

- NetScaler Gateway 11.x
- NetScaler Gateway 10.5
- NetScaler Gateway 10.1
- Access Gateway 10 Build 69.4 (the version number is displayed at the top of the configuration utility)

## **Plan your StoreFront deployment**

February 11, 2021

StoreFront employs Microsoft .NET technology running on Microsoft Internet Information Services (IIS) to provide enterprise app stores that aggregate resources and make them available to users. StoreFront integrates with your XenDesktop, XenApp, and App Controller deployments, providing users with a single, self-service access point for their desktops and applications.

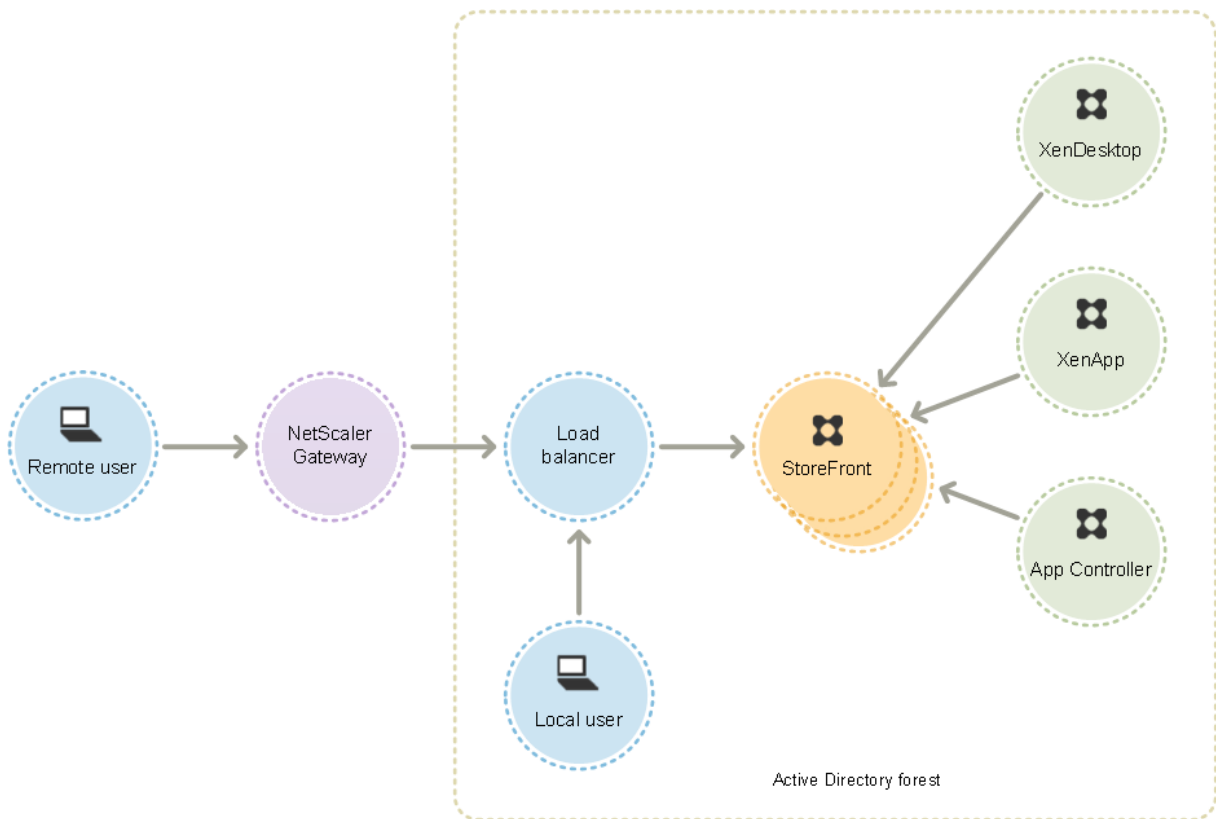

StoreFront comprises the following core components:

- The authentication service authenticates users to Microsoft Active Directory, ensuring that users do not need to log on again to access their desktops and applications. For more information, see [User authentication](#).
- Stores enumerate and aggregate desktops and applications from XenDesktop, XenApp, and App Controller. Users access stores through Citrix Receiver, Citrix Receiver for Web sites, Desktop Appliance sites, and XenApp Services URLs. For more information, see [User access options](#).
- The subscription store service records details of users' application subscriptions and updates their devices to ensure a consistent roaming experience. For more information about enhancing the experience for your users, see [Optimize the user experience](#).

StoreFront can be configured either on a single server or as a multiple server deployment. Multiple server deployments not only provide additional capacity, but also greater availability. The modular architecture of StoreFront ensures that configuration information and details of users' application subscriptions are stored on and replicated between all the servers in a server group. This means that if a StoreFront server becomes unavailable for any reason, users can continue to access their stores using the remaining servers. Meanwhile, the configuration and subscription data on the failed server are automatically updated when it reconnects to the server group. Subscription data is updated when the server comes back online but you must propagate configuration changes if any were missed by the server while offline. In the event of a hardware failure that requires replacement of the server, you can install StoreFront on a new server and add it to the existing server group. The new server is automatically configured and updated with users' application subscriptions when it joins the server group.

The figure shows a typical StoreFront deployment.

## Load balancing

For multiple server deployments, external load balancing through, for example, NetScaler or Windows Network Load Balancing is required. Configure the load balancing environment for failover between servers to provide a fault-tolerant deployment. For more information about load balancing with NetScaler, see [Load Balancing](#). For more information about Windows Network Load Balancing, see [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831698\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831698(v=ws.11)).

Active load balancing of requests sent from StoreFront to XenDesktop sites and XenApp farms is recommended for deployments with thousands of users or where high loads occur, such as when a large number of users log on over a short period of time. Use a load balancer with built-in XML monitors and session persistency, such as NetScaler.

If you deploy SSL-terminating load balancer or if you need to troubleshoot, you can use the PowerShell cmdlet **Set-STFWebReceiverCommunication**.

Syntax:

```
1 Set-STFWebReceiverCommunication [-WebReceiverService] <
   WebReceiverService> [[-Loopback] <On | Off |
2 OnUsingHttp>] [[-LoopbackPortUsingHttp] <Int32>]
```

```
3 <!--NeedCopy-->
```

The valid values are:

- **On** - This is the default value for new Citrix Receiver for Web sites. Citrix Receiver for Web uses the schema (HTTPS or HTTP) and port number from the base URL but replaces the host with the loopback IP address to communicate with StoreFront Services. This works for single server deployments and deployments with a non SSL-terminating load balancer.
- **OnUsingHttp** - Citrix Receiver for Web uses HTTP and the loopback IP address to communicate with StoreFront Services. If you are using an SSL-terminating load balancer, select this value. You must also specify the HTTP port if it is not the default port 80.
- **Off** - This turns off loopback and Citrix Receiver for Web uses the StoreFront base URL to communicate with StoreFront Services. If you perform an in-place upgrade, this is the default value to avoid disruption to your existing deployment.

For example, if you are using an SSL-terminating load balancer, your IIS is configured to use port 81 for HTTP and the path of your Citrix Receiver for Web site is /Citrix/StoreWeb, you can run the following command to configure the Citrix Receiver for Web site:

```
1 $wr = Get-STFWebReceiverService -VirtualPath /Citrix/StoreWeb
2 Set-STFWebReceiverCommunication -WebReceiverService $wr -Loopback
   OnUsingHttp -LoopbackPortUsingHttp 81
3 <!--NeedCopy-->
```

Note that you have to switch off loopback to use any web proxy tool like Fiddler to capture the network traffic between Citrix Receiver for Web and StoreFront Services.

## Active Directory considerations

For single server deployments you can install StoreFront on a non-domain-joined server (but certain functionality will be unavailable); otherwise, StoreFront servers must reside either within the Active Directory domain containing your users' accounts or within a domain that has a trust relationship with the user accounts domain unless you enable delegation of authentication to the XenApp and XenDesktop sites or farms. All the StoreFront servers in a group must reside within the same domain.

## User connections

In a production environment, Citrix recommends using HTTPS to secure communications between StoreFront and users' devices. To use HTTPS, StoreFront requires that the IIS instance hosting the authentication service and associated stores is configured for HTTPS. In the absence of the appropriate IIS configuration, StoreFront uses HTTP for communications. You can change from HTTP to HTTPS at any time, provided the appropriate IIS configuration is in place.

If you plan to enable access to StoreFront from outside the corporate network, NetScaler Gateway is required to provide secure connections for remote users. Deploy NetScaler Gateway outside the corporate network, with firewalls separating NetScaler Gateway from both the public and internal networks. Ensure that NetScaler Gateway is able to access the Active Directory forest containing the StoreFront servers.

## Multiple Internet Information Services (IIS) websites

StoreFront enables you to deploy different Stores in different IIS websites per Windows server so that each store can have a different host name and certificate binding.

Start by creating two websites, in addition to the default web site. After creating multiple websites in IIS, use the PowerShell SDK to create a StoreFront deployment in each of those IIS websites. For more information about creating websites in IIS, see [Create a Web Site](#).

**Note:** The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront management console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of PowerShell before opening the StoreFront console.

**Example:** To create two IIS website deployments - one for applications and one for desktop.

1. Add-STFDeployment -SiteID 1 -HostBaseURL "https://www.storefront.app.com"
2. Add-STFDeployment -SiteID 2 -HostBaseURL "https://www.storefront.desktop.com"

StoreFront disables the management console when it detects multiple sites and displays a message to that effect.

For more information, see [Before installing and configuring](#).

## Scalability

The number of Citrix Receiver users supported by a StoreFront server group depends on the hardware you use and on the level of user activity. Based on simulated activity where users log on, enumerate 100 published applications, and start one resource, expect a single StoreFront server with the minimum recommended specification of two virtual CPUs running on an underlying dual Intel Xeon L5520 2.27Ghz processor server to enable up to 30,000 user connections per hour.

Expect a server group with two similarly configured servers in the group to enable up to 60,000 user connections per hour; three nodes up to 90,000 connections per hour; four nodes up to 120,000 connections per hour; five nodes up to 150,000 connections per hour; six nodes up to 175,000 connections per hour.

The throughput of a single StoreFront server can also be increased by assigning more virtual CPUs to the system, with four virtual CPUs enabling up to 55,000 user connections per hour and eight virtual CPUs enabling 80,000 connections per hour.

The minimum recommended memory allocation for each server is 4GB. When using Citrix Receiver for Web, assign an additional 700 bytes per resource, per user in addition to the base memory allocation. As with using Web Receiver, when using Citrix Receiver, design environments to allow an extra 700 bytes per resource, per user on top of the base 4 GB memory requirements for this version of StoreFront.

As your usage patterns might be different than those simulated above, your servers might support more or fewer numbers of users connections per hour.

**Important:**

StoreFront server group deployments are only supported where links between servers in a server group have latency of less than 40 ms (with subscriptions disabled) or less than 3 ms (with subscriptions enabled). Ideally, all servers in a server group should reside in the same location (data center, availability zone), but server groups can span locations within the same region provided that links between servers in the group meet these latency criteria. Examples include server groups spanning availability zones within a cloud region, or between metropolitan area data centers. Note that latency between zones varies by cloud provider. Citrix do not recommend spanning locations as a disaster recovery configuration, but it may be suitable for high availability.

StoreFront server groups containing mixtures of operating system versions, or mixtures of operating system languages or locale configurations, are not supported.

**Timeout considerations**

Occasionally, network issues or other problems can occur between a StoreFront store and the servers that it contacts, causing delays or failures for users. You can use the timeout settings for a store to tune this behavior. If you specify a short timeout setting, StoreFront quickly abandons a server and tries another one. This is useful if, for example, you have configured multiple servers for failover purposes.

If you specify a longer timeout, StoreFront waits longer for a response from a single server. This is beneficial in environments where network or server reliability is uncertain and delays are common.

Citrix Receiver for Web also has a timeout setting, which controls how long a Citrix Receiver for Web site waits for a response from the store. Set this timeout setting to a value at least as long as the store timeout. A longer timeout setting allows for better fault tolerance, but users might experience long delays. A shorter timeout setting reduces delays for users, but they might experience more failures.

For information about setting timeouts, see [Communication time-out duration and server retry attempts](#) and [Communication time-out duration and retry attempts](#).

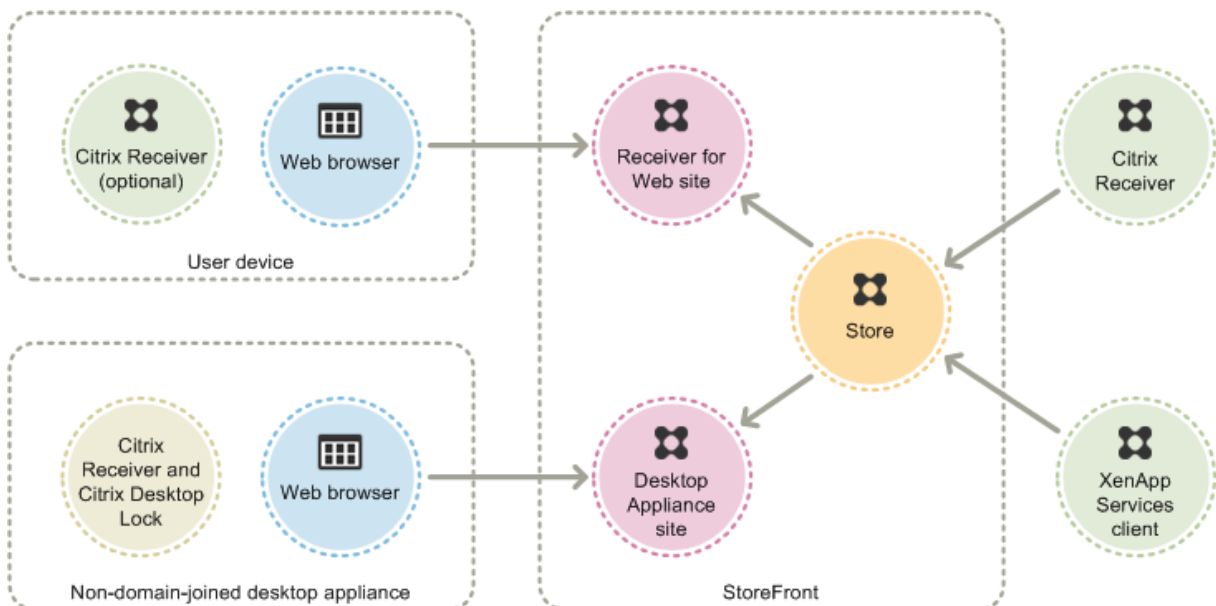

## User access options

January 4, 2019

Four different methods are available for users to access StoreFront stores.

- **Citrix Receiver** - Users with compatible versions of Citrix Receiver can access StoreFront stores within the Citrix Receiver user interface. Accessing stores within Citrix Receiver provides the best user experience and the greatest functionality.
- **Citrix Receiver for Web sites** - Users with compatible web browsers can access StoreFront stores by browsing to Citrix Receiver for Web sites. By default, users also require a compatible version of Citrix Receiver to access their desktops and applications. However, you can configure your Citrix Receiver for Web sites to enable users with HTML5-compatible browsers to access their resources without installing Citrix Receiver. When you create a new store, a Citrix Receiver for Web site is created for the store by default.
- **Desktop Appliance sites** - Users with non-domain-joined desktop appliances can access their desktops through the web browsers on their appliances, which are configured to access Desktop Appliance sites in full-screen mode. When you create a new store for a XenDesktop deployment using Citrix Studio, a Desktop Appliance site is created for the store by default.
- **XenApp Services URLs** - Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with users who have older Citrix clients that cannot be upgraded, can access stores using the XenApp Services URL for the store. When you create a new store, the XenApp Services URL is enabled by default.

The figure shows the options for users to access StoreFront stores:

## Citrix Receiver

Accessing stores from within the Citrix Receiver user interface provides the best user experience and the greatest functionality. For the Citrix Receiver versions that can be used to access stores in this way, see [System Requirements](#).

Citrix Receiver uses internal and external URLs as beacon points. By attempting to contact these beacon points, Citrix Receiver can determine whether users are connected to local or public networks. When a user accesses a desktop or application, the location information is passed to the server providing the resource so that appropriate connection details can be returned to Citrix Receiver. This enables Citrix Receiver to ensure that users are not prompted to log on again when they access a desktop or application. For more information, see [Configure beacon points](#).

After installation, Citrix Receiver must be configured with connection details for the stores providing users' desktops and applications. You can make the configuration process easier for your users by providing them with the required information in one of the following ways.

**Important:** By default, Citrix Receiver requires HTTPS connections to stores. If StoreFront is not configured for HTTPS, users must carry out additional configuration steps to use HTTP connections. Citrix strongly recommends that you do not enable unsecured user connections to StoreFront in a production environment. For more information, see [Configure and install Citrix Receiver for Windows using command-line parameters](#) in the Citrix Receiver for Windows documentation.

## Provisioning files

You can provide users with provisioning files containing connection details for their stores. After installing Citrix Receiver, users open the .cr file to automatically configure accounts for the stores. By default, Citrix Receiver for Web sites offer users a provisioning file for the single store for which the site is configured. You could instruct your users to visit the Receiver for Web sites for the stores they want to access and download provisioning files from those sites. Alternatively, for a greater level of control, you can use the Citrix StoreFront management console to generate provisioning files containing connection details for one or more stores. You can then distribute these files to the appropriate users. For more information, see [Export store provisioning files for users](#).

## Auto-generated setup URLs

For users running Mac OS, you can use the Citrix Receiver for Mac Setup URL Generator to create a URL containing connection details for a store. After installing Citrix Receiver, users click on the URL to configure an account for the store automatically. Enter details of your deployment into the tool and generate a URL that you can distribute to your users.

## **Manual configuration**

More advanced users can create new accounts by entering store URLs into Citrix Receiver. Remote users accessing StoreFront through NetScaler Gateway 10.1 and Access Gateway 10 enter the appliance URL. Citrix Receiver obtains the required account configuration information when the connection is first established. For connections through Access Gateway 9.3, users cannot set up accounts manually and must use one of the alternative methods above. For more information, see the Citrix Receiver documentation.

## **Email-based account discovery**

Users who install Citrix Receiver on a device for the first time can set up accounts by entering their email addresses, provided that they download Citrix Receiver from the Citrix website or a Citrix Receiver download page hosted within your internal network. You configure Service Location (SRV) locator resource records for NetScaler Gateway or StoreFront on your Microsoft Active Directory Domain Name System (DNS) server. Users do not need to know the access details for their stores, instead they enter their email addresses during the Citrix Receiver initial configuration process. Citrix Receiver contacts the DNS server for the domain specified in the email address and obtains the details you added to the SRV resource record. Users are then presented with a list of stores that they can access through Citrix Receiver.

## **Configure email-based account discovery**

Configure email-based account discovery to enable users who install Citrix Receiver on a device for the first time to set up their accounts by entering their email addresses. Provided that they download Citrix Receiver from the Citrix website or a Citrix Receiver download page hosted within your internal network, users do not need to know the access details for their stores when they install and configure Citrix Receiver. Email-based account discovery is available if Citrix Receiver is downloaded from any other location, such as a Receiver for Website. Note that ReceiverWeb.exe or ReceiverWeb.dmg downloaded from Citrix Receiver for Web does not prompt users to configure a store. Users can still use Add Account and enter their email address

During the initial configuration process, Citrix Receiver prompts users to enter either an email address or a store URL. When a user enters an email address, Citrix Receiver contacts the Microsoft Active Directory Domain Name System (DNS) server for the domain specified in the email address to obtain a list of available stores from which the user can select.

To enable Citrix Receiver to locate available stores on the basis of users' email addresses, you configure Service Location (SRV) locator resource records for NetScaler Gateway or StoreFront on your DNS server. As a fallback, you can also deploy StoreFront on a server named "discoverReceiver.domain," where domain is the domain containing your users' email accounts. If no SRV record is found in the

specified domain, Citrix Receiver searches for a machine named “discoverReceiver” to identify a StoreFront server.

You must install a valid server certificate on the NetScaler Gateway appliance or StoreFront server to enable email-based account discovery. The full chain to the root certificate must also be valid. For the best user experience, install a certificate with a Subject or Subject Alternative Name entry of discoverReceiver.domain, where domain is the domain containing your users’ email accounts. Although you can use a wildcard certificate for the domain containing your users’ email accounts, you must first ensure that the deployment of such certificates is permitted by your corporate security policy. Other certificates for the domain containing your users’ email accounts can also be used, but users will see a certificate warning dialog box when Citrix Receiver first connects to the StoreFront server. Email-based account discovery cannot be used with any other certificate identities.

To enable email-based account discovery for users connecting from outside the corporate network, you must also configure NetScaler Gateway with the StoreFront connection details. For more information, see [Connecting to StoreFront by Using Email-Based Discovery](#).

#### **Add an SRV record to your DNS server**

1. On the Windows **Start** screen, click **Administrative Tools** and, in the **Administrative Tools** folder, click **DNS**.
2. In the left pane of **DNS Manager**, select your domain in the forward or reverse lookup zones. Right-click the domain and select **Other New Records**.
3. In the **Resource Record Type** dialog box, select **Service Location (SRV)** and then click **Create Record**.
4. In the **New Resource Record** dialog box, enter in the **Service** box the host value **\_citrixreceiver**.
5. Enter in the **Protocol** box the value **\_tcp**.
6. In the **Host offering this service** box, specify the fully qualified domain name (FQDN) and port for your NetScaler Gateway appliance (to support both local and remote users) or StoreFront server (to support local users only) in the form\* **servername.domain:port\***.

If your environment includes both internal and external DNS servers, you can add a SRV record specifying the StoreFront server FQDN on your internal DNS server and another record on your external server specifying the NetScaler Gateway FQDN. With this configuration, local users are provided with the StoreFront details, while remote users receive NetScaler Gateway connection information.

7. If you configured an SRV record for your NetScaler Gateway appliance, add the StoreFront connection details to NetScaler Gateway in a session profile or global setting.

## Citrix Receiver for Web sites

Users with compatible web browsers can access StoreFront stores by browsing to Citrix Receiver for Web sites. When you create a new store, a Citrix Receiver for Web site is automatically created for the store. The default configuration for Citrix Receiver for Web sites requires that users install a compatible version of Citrix Receiver to access their desktops and applications. For more information about the Citrix Receiver and web browser combinations that can be used to access Citrix Receiver for Web sites, see [User device requirements](#).

By default, when a user accesses a Citrix Receiver for Web site from a computer running Windows or Mac OS X, the site attempts to determine whether Citrix Receiver is installed on the user's device. If Citrix Receiver cannot be detected, the user is prompted to download and install the appropriate Citrix Receiver for their platform. The default download location is the Citrix website, but you can also copy the installation files to the StoreFront server and provide users with these local files instead. Storing the Citrix Receiver installation files locally enables you to configure the site to offer users with older clients the option to upgrade to the version on the server. For more information about configuring deployment of Citrix Receiver for Windows and Citrix Receiver for Mac, see [Configure Citrix Receiver for Web sites](#).

## Citrix Receiver for HTML5

Citrix Receiver for HTML5 is a component of StoreFront that is integrated by default with Citrix Receiver for Web sites. You can enable Citrix Receiver for HTML5 on your Citrix Receiver for Web sites so that users who cannot install Citrix Receiver can still access their resources. With Citrix Receiver for HTML5, users can access desktops and applications directly within HTML5-compatible web browsers without needing to install Citrix Receiver. When a site is created, Citrix Receiver for HTML5 is disabled by default. For more information about enabling Citrix Receiver for HTML5, see [citrix-receiver-download-page-template.html](#).

To access their desktops and applications using Citrix Receiver for HTML5, users must access the Citrix Receiver for Web site with an HTML5-compatible browser. For more information about the operating systems and web browsers that can be used with Citrix Receiver for HTML5, see [User device requirements](#).

Citrix Receiver for HTML5 can be used by both users on the internal network and remote users connecting through NetScaler Gateway. For connections from the internal network, Citrix Receiver for HTML5 only supports access to desktops and applications provided by a subset of the products supported by Citrix Receiver for Web sites. Users connecting through NetScaler Gateway can access resources provided by a wider range of products if you chose Citrix Receiver for HTML5 as an option when configuring StoreFront. Specific versions of NetScaler Gateway are required for use with Citrix Receiver for HTML5. For more information, see [Infrastructure requirements](#).

For local users on the internal network, access through Citrix Receiver for HTML5 to resources pro-

vided by XenDesktop and XenApp is disabled by default. To enable local access to desktops and applications using Citrix Receiver for HTML5, you must enable the ICA WebSockets connections policy on your XenDesktop and XenApp servers. Ensure your firewalls and other network devices permit access to the Citrix Receiver for HTML5 port specified in the policy. For more information, see [WebSockets policy settings](#).

By default, Citrix Receiver for HTML5 starts desktops and applications in a new browser tab. However, when users start resources from shortcuts using Citrix Receiver for HTML5, the desktop or application replaces the Citrix Receiver for Web site in the existing browser tab rather than appearing in a new tab. You can configure Citrix Receiver for HTML5 so that resources are always started in the same tab as the Receiver for Web site. For more information, see [Configure Citrix Receiver for HTML5 use of browser tabs](#).

### **Resource shortcuts**

You can generate URLs that provide access to desktops and applications available through Citrix Receiver for Web sites. Embed these links on websites hosted on the internal network to provide users with rapid access to resources. Users click on a link and are redirected to the Receiver for Web site, where they log on if they have not already done so. The Citrix Receiver for Web site automatically starts the resource. In the case of applications, users are also subscribed to the application if they have not subscribed previously. For more information about generating resource shortcuts, see [Configure Citrix Receiver for Web sites](#).

As with all desktops and applications accessed from Citrix Receiver for Web sites, users must either have installed Citrix Receiver or be able to use Citrix Receiver for HTML5 to access resources through shortcuts. The method used by a Citrix Receiver for Web site depends on the site configuration, on whether Citrix Receiver can be detected on users' devices, and on whether an HTML5-compatible browser is used. For security reasons, Internet Explorer users may be prompted to confirm that they want to start resources accessed through shortcuts. Instruct your users to add the Receiver for Web site to the Local intranet or Trusted sites zones in Internet Explorer to avoid this extra step. By default, both workspace control and automatic desktop starts are disabled when users access Citrix Receiver for Web sites through shortcuts.

When you create an application shortcut, ensure that no other applications available from the Citrix Receiver for Web site have the same name. Shortcuts cannot distinguish between multiple instances of an application with the same name. Similarly, if you make multiple instances of a desktop from a single desktop group available from the Citrix Receiver for Web site, you cannot create separate shortcuts for each instance. Shortcuts cannot pass command-line parameters to applications.

To create application shortcuts, you configure StoreFront with the URLs of the internal websites that will host the shortcuts. When a user clicks on an application shortcut on a website, StoreFront checks that website against the list of URLs you entered to ensure that the request originates from a trusted

website. However, for users connecting through NetScaler Gateway, websites hosting shortcuts are not validated because the URLs are not passed to StoreFront. To ensure that remote users can only access application shortcuts on trusted internal websites, configure NetScaler Gateway to restrict user access to only those specific sites. For more information, see <http://support.citrix.com/article/CTX123610>.

### **Customize your sites**

Citrix Receiver for Web sites provide a mechanism for customizing the user interface. You can customize strings, the cascading style sheet, and the JavaScript files. You can also add a custom pre-logout or post-logout screen, and add language packs.

### **Important considerations**

Users accessing stores through a Citrix Receiver for Web site benefit from many of the features available with store access within Citrix Receiver, such as application synchronization. When you decide whether to use Citrix Receiver for Web sites to provide users with to access your stores, consider the following restrictions.

- Only a single store can be accessed through each Citrix Receiver for Web site.
- Citrix Receiver for Web sites cannot initiate Secure Sockets Layer (SSL) virtual private network (VPN) connections. Users logging on through NetScaler Gateway without a VPN connection cannot access web applications for which App Controller requires that such a connection is used.
- Subscribed applications are not available on the Windows Start screen when accessing a store through a Citrix Receiver for Web site.
- File type association between local documents and hosted applications accessed through Citrix Receiver for Web sites is not available.
- Offline applications cannot be accessed through Citrix Receiver for Web sites.
- Citrix Receiver for Web sites do not support Citrix Online products integrated into stores. Citrix Online products must be delivered with App Controller or made available as hosted applications to enable access through Citrix Receiver for Web sites.
- Citrix Receiver for HTML5 can be used over HTTPS connections if the VDA is XenApp 7.6 or XenDesktop 7.6 and has SSL enabled or if the user is connecting using NetScaler Gateway.
- To use Citrix Receiver for HTML5 with Mozilla Firefox over HTTPS connections, users must type `about:config` in the Firefox address bar and set the `network.websocket.allowInsecureFromHTTPS` preference to true.

### **Desktop Appliance sites**

Users with non-domain-joined desktop appliances can access their desktops through Desktop Appliance sites. Non-domain-joined in this context means devices that are not joined to a domain within

the Microsoft Active Directory forest containing the StoreFront servers.

When you create a new store for a XenDesktop deployment using Citrix Studio, a Desktop Appliance site is created for the store by default. Desktop Appliance sites are only created by default when StoreFront is installed and configured as part of a XenDesktop installation. You can create Desktop Appliance sites manually using Windows PowerShell commands. For more information, see [Configure Desktop Appliance sites](#).

Desktop Appliance sites provide a user experience that is similar to logging on to a local desktop. The web browsers on desktop appliances are configured to start in full-screen mode displaying the logon screen for a Desktop Appliance site. When a user logs on to a site, by default, the first desktop (in alphabetical order) available to the user in the store for which the site is configured starts automatically. If you provide users with access to multiple desktops in a store, you can configure the Desktop Appliance site to display the available desktops so users can choose which one to access. For more information, see [Configure Desktop Appliance sites](#).

When a user's desktop starts, it is displayed in full-screen mode, obscuring the web browser. The user is automatically logged out from the Desktop Appliance site. When the user logs off from the desktop, the web browser, displaying the Desktop Appliance site logon screen, is visible again. A message is displayed when a desktop is started, providing a link for the user to click to restart the desktop if it cannot be accessed. To enable this functionality, you must configure the Delivery Group to enable users to restart their desktops. For more information, see [Delivery groups](#).

To provide access to desktops, a compatible version of Citrix Receiver is required on the desktop appliance. Typically, XenDesktop-compatible appliance vendors integrate Citrix Receiver into their products. For Windows appliances, the Citrix Desktop Lock must also be installed and configured with the URL for your Desktop Appliance site. If Internet Explorer is used, the Desktop Appliance site must be added to the Local intranet or Trusted sites zones. For more information about the Citrix Desktop Lock, see [Prevent user access to the local desktop](#).

### **Important considerations**

Desktop Appliance sites are intended for local users on the internal network accessing desktops from non-domain-joined desktop appliances. When you decide whether to use Desktop Appliance sites to provide users with access to your stores, consider the following restrictions.

- If you plan to deploy domain-joined desktop appliances and repurposed PCs, do not configure them to access stores through Desktop Appliance sites. Though you can configure Citrix Receiver with the XenApp Services URL for the store, we recommend the new Desktop Lock for both domain-joined and nondomain-joined use cases. For more information, see [Citrix Receiver Desktop Lock](#).
- Desktop Appliance sites do not support connections from remote users outside the corporate network. Users logging on to NetScaler Gateway cannot access Desktop Appliance sites.

## XenApp Services URLs

Users with older Citrix clients that cannot be upgraded can access stores by configuring their clients with the XenApp Services URL for a store. You can also enable access to your stores through XenApp Services URLs from domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock. Domain-joined in this context means devices that are joined to a domain within the Microsoft Active Directory forest containing the StoreFront servers.

StoreFront supports pass-through authentication with proximity cards through Citrix Receiver to XenApp Services URLs. Citrix Ready partner products use the Citrix Fast Connect API to streamline user logons through Citrix Receiver for Windows to connect to stores using the XenApp Services URL. Users authenticate to workstations using proximity cards and are rapidly connected to desktops and applications provided by XenDesktop and XenApp. For more information, see the most recent [Citrix Receiver for Windows](#) documentation.

When you create a new store, the XenApp Services URL for the store is enabled by default. The XenApp Services URL for a store has the form `http[s]://serveraddress/Citrix/storename/PNAgent/config.xml`, where `serveraddress` is the fully qualified domain name of the server or load balancing environment for your StoreFront deployment and `storename` is the name specified for the store when it was created. This allows Citrix Receivers that can only use the PNAgent protocol to connect to Storefront. For the clients that can be used to access stores through XenApp Services URLs, see [User device requirements](#).

## Important considerations

XenApp Services URLs are intended to support users who cannot upgrade to Citrix Receiver and for scenarios where alternative access methods are not available. When you decide whether to use XenApp Services URLs to provide users with access to your stores, consider the following restrictions.

- You cannot modify the XenApp Services URL for a store.
- You cannot modify XenApp Services URL settings by editing the configuration file, `config.xml`.
- XenApp Services URLs support explicit, domain pass-through, smart card authentication, and pass-through with smart card authentication. Explicit authentication is enabled by default. Only one authentication method can be configured for each XenApp Services URL and only one URL is available per store. If you need to enable multiple authentication methods, you must create separate stores, each with a XenApp Services URL, for each authentication method. Your users must then connect to the appropriate store for their method of authentication. For more information, see [XML-based authentication](#).
- Workspace control is enabled by default for XenApp Services URLs and cannot be configured or disabled.
- User requests to change their passwords are routed to the domain controller directly through the XenDesktop and XenApp servers providing desktops and applications for the store, bypassing the StoreFront authentication service.

## User authentication

October 13, 2020

StoreFront supports a number of different authentication methods for users accessing stores; although, not all are available depending on the user access method and their network location. For security reasons, some authentication methods are disabled by default when you create your first store. For more information about enabling and disabling user authentication methods, see [Create and configure the authentication service](#).

### User name and password

Users enter their credentials and are authenticated when they access their stores. Explicit authentication is enabled by default. All user access methods support explicit authentication.

When a user employs NetScaler Gateway to access Citrix Receiver for Web, NetScaler Gateway handles the logon and password change at expiration. Users can make elective password changes with the Citrix Receiver for Web UI. After an elective password change, the NetScaler Gateway session terminates and the user must log on again. Citrix Receiver for Linux users can change only expired passwords.

### SAML authentication

Users authenticate to a SAML Identity Provider and are automatically logged on when they access their stores. StoreFront can support SAML authentication directly within the corporate network, without the need to go through NetScaler.

SAML (Security Assertion Markup Language) is an open standard used by identity and authentication products such as Microsoft AD FS (Active Directory Federation Services). With the integration of SAML authentication through StoreFront, administrators can allow users to, for example, log on once to their corporate network and then get single sign-on to their published apps.

Requirements:

- Implementation of the [Citrix Federated Authentication Service](#).
- SAML 2.0-compliant identity providers (IdPs):
  - Microsoft AD FS v4.0 (Windows Server 2016) using SAML bindings only (not WS-Federation bindings). For more information, see [AD FS Deployment](#) and [AD FS Operations](#).
  - Microsoft AD FS v3.0 (Windows Server 2012 R2)
  - Microsoft AD FS v2.0 (Windows Server 2008 R2)
  - NetScaler Gateway (configured as an IdP)
- Configure SAML authentication in StoreFront using the StoreFront management console in a new deployment (see [Create a new deployment](#)), or in an existing deployment (see [Configure](#)

[the authentication service](#)). You can also configure SAML authentication using PowerShell cmdlets, see [StoreFront SDK](#).

- Citrix Receiver for Windows (4.6 and higher) or Citrix Receiver for Web.

Using SAML authentication with NetScaler is currently supported with Receiver for Web sites.

## Domain pass-through

Users authenticate to their domain-joined Windows computers, and their credentials are used to log them on automatically when they access their stores. When you install StoreFront, domain pass-through authentication is disabled by default. Domain pass-through authentication can be enabled for users connecting to stores through Citrix Receiver and XenApp Services URLs. Citrix Receiver for Web sites support domain pass-through authentication for Internet Explorer, Microsoft Edge, Mozilla Firefox, and Google Chrome. Enable domain pass-through authentication in the Citrix Receiver for Web site node in the administration console and requires you to configure SSON on Citrix Receiver for Windows. Citrix Receiver for HTML5 does not support domain pass-through authentication. To use domain pass-through authentication, users require Citrix Receiver for Windows or the Online Plug-in for Windows. Pass-through authentication must be enabled when Citrix Receiver for Windows or the Online Plug-in for Windows are installed on users' devices.

## Pass-through from NetScaler Gateway

Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores. Pass-through from NetScaler Gateway authentication is enabled by default when you first configure remote access to a store. Users can connect through NetScaler Gateway to stores using Citrix Receiver or Citrix Receiver for Web sites. Desktop Appliance sites do not support connections through NetScaler Gateway. For more information about configuring StoreFront for NetScaler Gateway, see [Add a NetScaler Gateway connection](#).

StoreFront supports pass-through with the following NetScaler Gateway authentication methods.

- **Security token.** Users log on to NetScaler Gateway using passcodes that are derived from tokens generated by security tokens combined, in some cases, with personal identification numbers. If you enable pass-through authentication by security token only, ensure that the resources you make available do not require additional or alternative forms of authentication, such as users' Microsoft Active Directory domain credentials.
- **Domain and security token.** Users logging on to NetScaler Gateway are required to enter both their domain credentials and security token passcodes.
- **Client certificate.** Users log on to NetScaler Gateway and are authenticated based on the attributes of the client certificate presented to NetScaler Gateway. Configure client certificate authentication to enable users to log on to NetScaler Gateway using smart cards. Client certifi-

cate authentication can also be used with other authentication types to provide double-source authentication.

StoreFront uses the NetScaler Gateway authentication service to provide pass-through authentication for remote users so that they only need to enter their credentials once. However, by default, pass-through authentication is only enabled for users logging on to NetScaler Gateway with a password. To configure pass-through authentication from NetScaler Gateway to StoreFront for smart card users, delegate credential validation to NetScaler Gateway. For more information, see [Create and configure the authentication service](#).

Users can connect to stores within Citrix Receiver with pass-through authentication through a Secure Sockets Layer (SSL) virtual private network (VPN) tunnel using the NetScaler Gateway Plug-in. Remote users who cannot install the NetScaler Gateway Plug-in can use clientless access to connect to stores within Citrix Receiver with pass-through authentication. To use clientless access to connect to stores, users require a version of Citrix Receiver that supports clientless access.

Additionally, you can enable clientless access with pass-through authentication to Citrix Receiver for Web sites. To do this, configure NetScaler Gateway to act as a secure remote proxy. Users log on to NetScaler Gateway directly and use the Citrix Receiver for Web site to access their applications without needing to authenticate again.

Users connecting with clientless access to App Controller resources can only access external software-as-a-service (SaaS) applications. To access internal web applications, remote users must use the NetScaler Gateway Plug-in.

If you configure double-source authentication to NetScaler Gateway for remote users accessing stores from within Citrix Receiver, you must create two authentication policies on NetScaler Gateway. Configure RADIUS (Remote Authentication Dial-In User Service) as the primary authentication method and LDAP (Lightweight Directory Access Protocol) as the secondary method. Modify the credential index to use the secondary authentication method in the session profile so that LDAP credentials are passed to StoreFront. When you add the NetScaler Gateway appliance to your StoreFront configuration, set the Logon type to Domain and security token. For more information, see <http://support.citrix.com/article/CTX125364>

To enable multidomain authentication through NetScaler Gateway to StoreFront, set SSO Name Attribute to userPrincipalName in the NetScaler Gateway LDAP authentication policy for each domain. You can require users to specify a domain on the NetScaler Gateway logon page so that the appropriate LDAP policy to use can be determined. When you configure the NetScaler Gateway session profiles for connections to StoreFront, do not specify a single sign-on domain. You must configure trust relationships between each of the domains. Ensure that you allow users to log on to StoreFront from any domain by not restricting access to explicitly trusted domains only.

Where supported by your NetScaler Gateway deployment, you can use SmartAccess to control user access to XenDesktop and XenApp resources on the basis of NetScaler Gateway session policies. For

more information about SmartAccess, see [How SmartAccess works for XenApp and XenDesktop](#).

## **Smart cards**

Users authenticate using smart cards and PINs when they access their stores. When you install StoreFront, smart card authentication is disabled by default. Smart card authentication can be enabled for users connecting to stores through Citrix Receiver, Citrix Receiver for Web, Desktop Appliance sites, and XenApp Services URLs.

Use smart card authentication to streamline the logon process for your users while also enhancing the security of user access to your infrastructure. Access to the internal corporate network is protected by certificate-based two-factor authentication using public key infrastructure. Private keys are protected by hardware controls and never leave the smart card. Your users get the convenience of accessing their desktops and applications from a range of corporate devices using their smart cards and PINs.

You can use smart cards for user authentication through StoreFront to desktops and applications provided by XenDesktop and XenApp. Smart card users logging on to StoreFront can also access applications provided by App Controller. However, users must authenticate again to access App Controller web applications that use client certificate authentication.

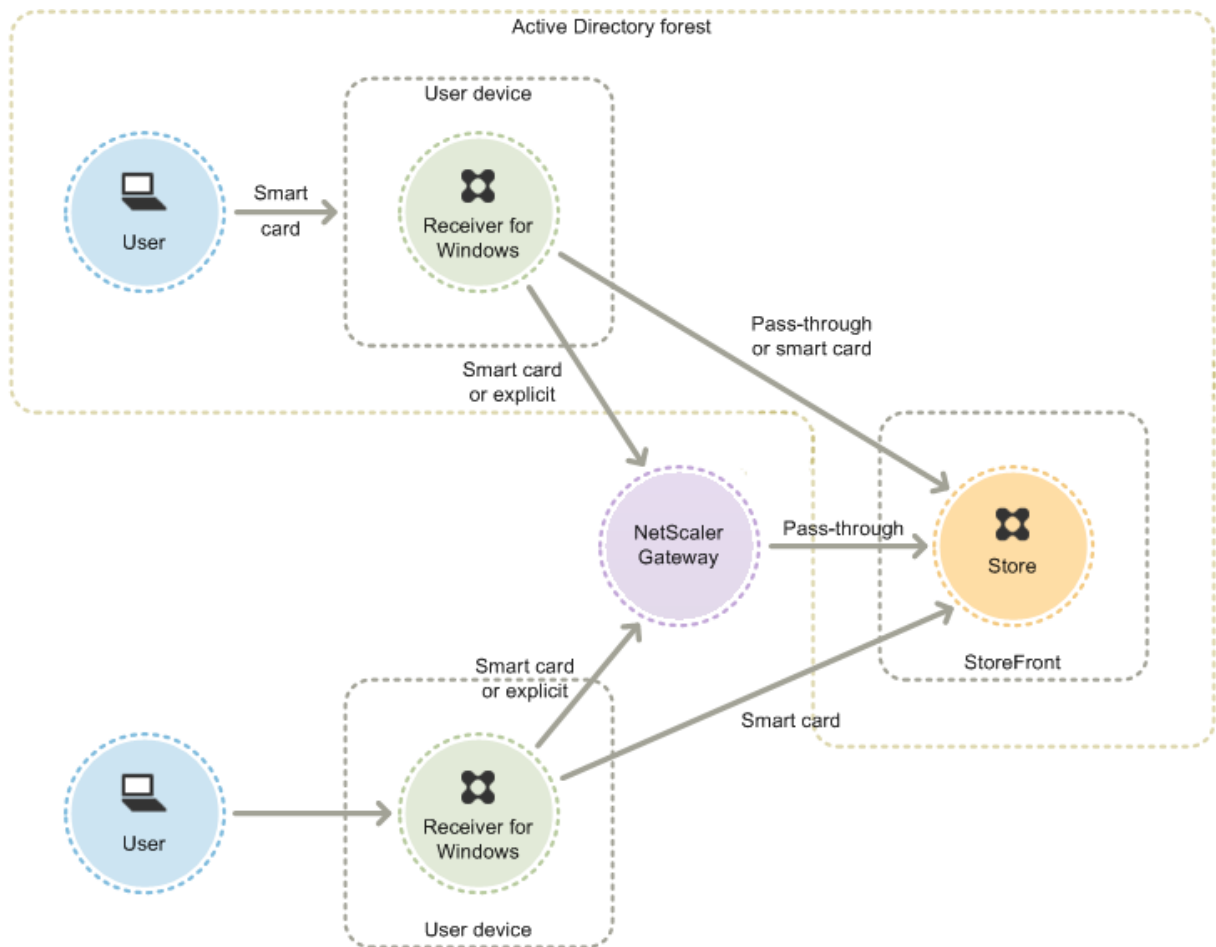

To enable smart card authentication, users' accounts must be configured either within the Microsoft Active Directory domain containing the StoreFront servers or within a domain that has a direct two-way trust relationship with the StoreFront server domain. Multi-forest deployments involving two-way trusts are supported.

The configuration of smart card authentication with StoreFront depends on the user devices, the clients installed, and whether the devices are domain-joined. In this context, domain-joined means devices that are joined to a domain within the Active Directory forest containing the StoreFront servers.

### **Use smart cards with Citrix Receiver for Windows**

Users with devices running Citrix Receiver for Windows can authenticate using smart cards, either directly or through NetScaler Gateway. Both domain-joined and non-domain-joined devices can be used, although the user experience is slightly different.

The figure shows the options for smart card authentication through Citrix Receiver for Windows.

For local users with domain-joined devices, you can configure smart card authentication so that users are only prompted for their credentials once. Users log on to their devices using their smart cards and PINs and, with the appropriate configuration in place, are not prompted for their PINs again. Users are silently authenticated to StoreFront and also when they access their desktops and applications. To achieve this, you configure Citrix Receiver for Windows for pass-through authentication and enable domain pass-through authentication to StoreFront.

Users log on to their devices and then authenticate to Citrix Receiver for Windows using their PINs. There is no further PIN prompts when they try to start apps and desktops

Because users of non-domain-joined devices log on to Citrix Receiver for Windows directly, you can enable users to fall back to explicit authentication. If you configure both smart card and explicit authentication, users are initially prompted to log on using their smart cards and PINs but have the option to select explicit authentication if they experience any issues with their smart cards.

Users connecting through NetScaler Gateway must log on using their smart cards and PINs at least twice to access their desktops and applications. This applies to both domain-joined and non-domain-joined devices. Users authenticate using their smart cards and PINs, and, with the appropriate configuration in place, are only prompted to enter their PINs again when they access their desktops and ap-

plications. To achieve this, you enable pass-through with NetScaler Gateway authentication to StoreFront and delegate credential validation to NetScaler Gateway. Then, create an additional NetScaler Gateway virtual server through which you route user connections to resources. In the case of domain-joined devices, you must also configure Citrix Receiver for Windows for pass-through authentication.

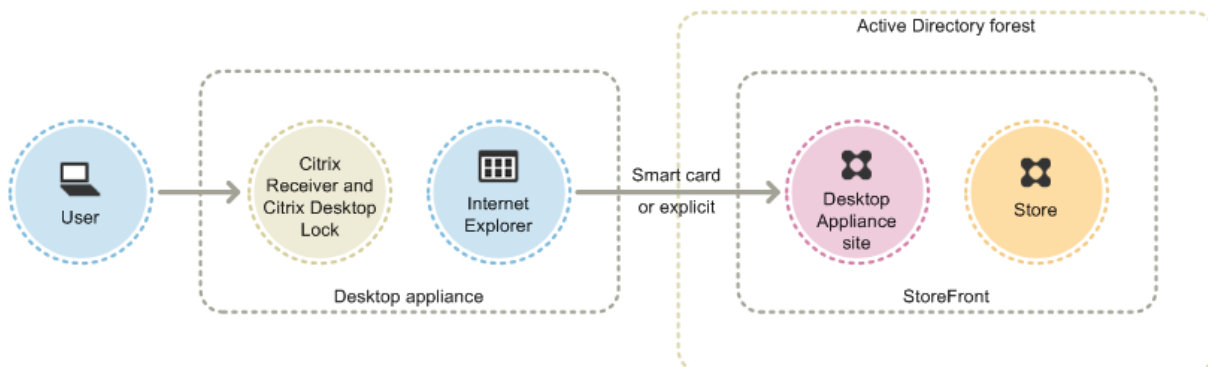

**Note:** If you are using Citrix Receiver for Windows 4.2 - the current version, you can set up a second vServer and use the optimal gateway routing feature to remove the need for PIN prompts when starting apps and desktops.

Users can log on to NetScaler Gateway using either their smart cards and PINs, or with explicit credentials. This enables you to provide users with the option to fall back to explicit authentication for NetScaler Gateway logons. Configure pass-through authentication from NetScaler Gateway to StoreFront and delegate credential validation to NetScaler Gateway for smart card users so that users are silently authenticated to StoreFront.

### Use smart cards with Desktop Appliance sites

Non-domain-joined Windows desktop appliances can be configured to enable users to log on to their desktops using smart cards. The Citrix Desktop Lock is required on the appliance and Internet Explorer must be used to access the Desktop Appliance site.

The figure shows smart card authentication from a non-domain-joined desktop appliance.

When users access their desktop appliances, Internet Explorer starts in full-screen mode displaying the logon screen for a Desktop Appliance site. Users authenticate to the site using their smart cards and PINs. If the Desktop Appliance site is configured for pass-through authentication, users are automatically authenticated when they access their desktops and applications. Users are not prompted for their PINs again. Without pass-through authentication, users must enter their PINs a second time when they start a desktop or application.

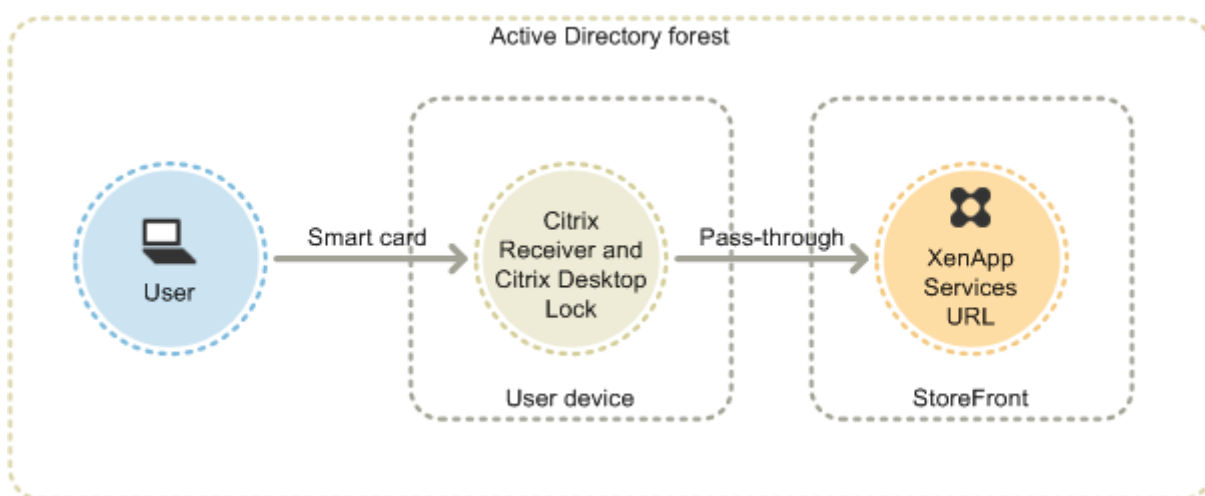

You can enable users to fall back to explicit authentication if they experience any issues with their smart cards. To do this, you configure the Desktop Appliance site for both smart card and explicit authentication. In this configuration, smart card authentication is considered to be primary access

method so users are prompted for their PINs first. However, the site also provides a link that enables users to log on with explicit credentials instead.

### Use smart cards with XenApp Services URLs

Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock can authenticate using smart cards. Unlike other access methods, pass-through of smart card credentials is automatically enabled when smart card authentication is configured for a XenApp Services URL.

The figure shows smart card authentication from a domain-joined device running the Citrix Desktop Lock.

Users log on to their devices using their smart cards and PINs. The Citrix Desktop Lock then silently authenticates users to StoreFront through the XenApp Services URL. Users are automatically authenticated when they access their desktops and applications, and are not prompted for their PINs again.

### Use smart cards with Citrix Receiver for Web

You can enable smart card authentication to Citrix Receiver for Web from the StoreFront Administration Console.

1. Select the Citrix Receiver for Web node in the left panel.
2. Select the site you want to use smart card authentication.
3. Select the Choose Authentication Methods task in the right panel.
4. Check the Smart card checkbox in the popup dialog screen and click OK.

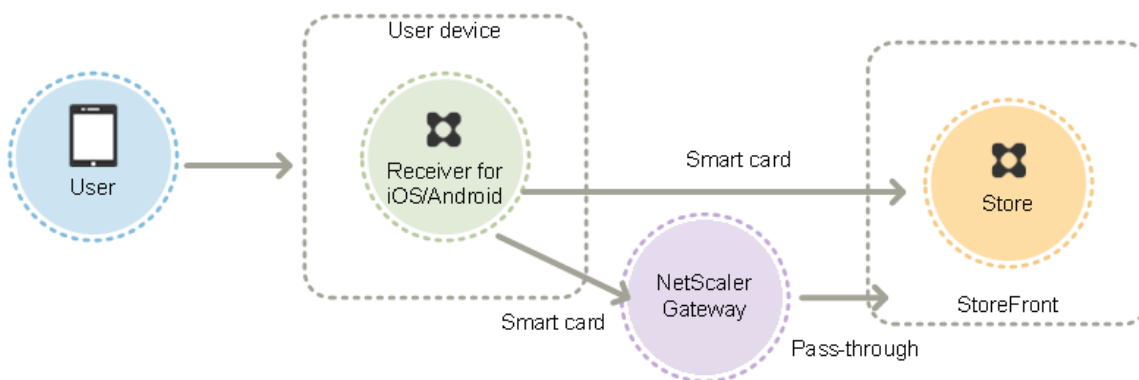

If you enable pass-through with smart card authentication to XenDesktop and XenApp for Citrix Receiver for Windows users with domain-joined devices who do not access stores through NetScaler Gateway, this setting applies to all users of the store. To enable both domain pass-through and pass-through with smart card authentication to desktops and applications, you must create separate stores

for each authentication method. Your users must then connect to the appropriate store for their method of authentication.

If you enable pass-through with smart card authentication to XenDesktop and XenApp for Citrix Receiver for Windows users with domain-joined devices accessing stores through NetScaler Gateway, this setting applies to all users of the store. To enable pass-through authentication for some users and require others to log on to their desktops and applications, you must create separate stores for each group of users. Then, direct your users to the appropriate store for their method of authentication.

### Use smart cards with Citrix Receiver for iOS and Android

Users with devices running Citrix Receiver for iOS and Citrix Receiver for Android can authenticate using smart cards, either directly or through NetScaler Gateway. Non-domain-joined devices can be used.

In the case of devices on the local network, the minimum number of logon prompts that users can receive is two. When users authenticate to StoreFront or initially create the store, they are prompted for the smart card PIN. With the appropriate configuration in place, users are prompted to enter their PINs again only when they access their desktops and applications. To achieve this, you enable smart card authentication to StoreFront and install smart card drivers on the VDA.

With these Citrix Receivers, you have the option of specifying smart cards OR domain credentials. If you created a store to use smart cards and you want to connect to the same store using domain credentials, you must add a separate store without turning on smart cards.

Users connecting through NetScaler Gateway must log on using their smart cards and PINs at least twice to access their desktops and applications. Users authenticate using their smart cards and PINs, and, with the appropriate configuration in place, are only prompted to enter their PINs again when they access their desktops and applications. To achieve this, you enable pass-through with NetScaler Gateway authentication to StoreFront and delegate credential validation to NetScaler Gateway. Then, create an additional NetScaler Gateway virtual server through which you route user connections to resources.

Users can log on to NetScaler Gateway using either their smart cards and PINs or with explicit credentials, depending on how you specified the authentication for the connection. Configure pass-through authentication from NetScaler Gateway to StoreFront and delegate credential validation to NetScaler Gateway for smart card users so that users are silently authenticated to StoreFront. If you want to change the authentication method, you must delete and recreate the connection.

### **Use smart cards with Citrix Receiver for Linux**

Users with devices running Citrix Receiver for Linux can authenticate using smart cards in a similar way to users of non-domain-joined Windows devices. Even if the user authenticates to the Linux device with a smart card, Citrix Receiver for Linux has no mechanism to acquire or reuse the PIN entered.

Configure the server side components for smart cards the same way you configure them for use with the Citrix Receiver for Windows. Refer to [How To Configure StoreFront 2.x and Smart Card Authentication for Internal Users using Stores](#) and for instructions on using smart cards, see [Citrix Receiver for Linux](#).

The minimum number of logon prompts that users can receive is one. Users log on to their devices and then authenticate to Citrix Receiver for Linux using their smart cards and PINs. Users are not prompted to enter their PINs again when they access their desktops and applications. To achieve this, you enable smart card authentication to StoreFront.

Because users log on to Citrix Receiver for Linux directly, you can enable users to fall back to explicit authentication. If you configure both smart card and explicit authentication, users are initially prompted to log on using their smart cards and PINs but have the option to select explicit authentication if they experience any issues with their smart cards.

Users connecting through NetScaler Gateway must log on using their smart cards and PINs at least once to access their desktops and applications. Users authenticate using their smart cards and PINs and, with the appropriate configuration in place, are not prompted to enter their PINs again when they access their desktops and applications. To achieve this, you enable pass-through with NetScaler Gateway authentication to StoreFront and delegate credential validation to NetScaler Gateway. Then, create an additional NetScaler Gateway virtual server through which you route user connections to resources.

Users can log on to NetScaler Gateway using either their smart cards and PINs, or with explicit credentials. This enables you to provide users with the option to fall back to explicit authentication for NetScaler Gateway logons. Configure pass-through authentication from NetScaler Gateway to StoreFront and delegate credential validation to NetScaler Gateway for smart card users so that users are silently authenticated to StoreFront.

Smart cards for Citrix Receiver for Linux are not supported with the XenApp Services Support sites.

Once smart card support is enabled for both the server and Citrix Receiver, provided the application policy of the smart card certificates allow it, you can use smart cards for the following purposes:

- Smart card logon authentication. Use smart cards to authenticate users to Citrix XenApp and XenDesktop servers.
- Smart card application support. Enable smart card-aware published applications to access local smart card devices.

### **Use smart cards with XenApp Services Support**

Users logging on to XenApp Services Support sites to start applications and desktops can authenticate using smart cards without depending on specific hardware, operating systems, and Citrix Receivers. When a user accesses a XenApp Services Support site and successfully enters a smart card and PIN, PNA determines the user identity, authenticates the user with StoreFront, and returns the available resources.

For pass-through and smart card authentication to work, you must enable Trust requests sent to the XML service.

Use an account with local administrator permissions on the Delivery Controller to start Windows PowerShell and, at a command prompt, enter the following commands to enable the Delivery Controller to trust XML requests sent from StoreFront. The following procedure applies to XenApp 7.5 through 7.8 and XenDesktop 7.0 through 7.8.

1. Load the Citrix cmdlets by typing `asnp Citrix*`. (including the period).
2. Type **Add-PSSnapin citrix.broker.admin.v2**.
3. Type **Set-BrokerSite -TrustRequestsSentToTheXmlServicePort \$True**
4. Close PowerShell.

For information about configuring the XenApp Services Support smart card authentication method, see [Configure authentication for XenApp Services URLs](#).

### **Important considerations**

Use of smart cards for user authentication with StoreFront is subject to the following requirements and restrictions.

- To use virtual private network (VPN) tunnels with smart card authentication, users must install the NetScaler Gateway Plug-in and log on through a web page, using their smart cards and PINs to authenticate at each step. Pass-through authentication to StoreFront with the NetScaler Gateway Plug-in is not available for smart card users.
- Multiple smart cards and multiple readers can be used on the same user device, but if you enable pass-through with smart card authentication, users must ensure that only one smart card is inserted when accessing a desktop or application.

- When a smart card is used within an application, such as for digital signing or encryption, users might see additional prompts to insert a smart card or enter a PIN. This can occur if more than one smart card has been inserted at the same time. It can also occur due to configuration settings - such as middleware settings like PIN caching that are typically configured using group policy. Users who are prompted to insert a smart card when the smart card is already in the reader must click Cancel. If users are prompted for a PIN, they must enter their PINs again.
- If you enable pass-through with smart card authentication to XenDesktop and XenApp for Citrix Receiver for Windows users with domain-joined devices who do not access stores through NetScaler Gateway, this setting applies to all users of the store. To enable both domain pass-through and pass-through with smart card authentication to desktops and applications, you must create separate stores for each authentication method. Your users must then connect to the appropriate store for their method of authentication.
- If you enable pass-through with smart card authentication to XenDesktop and XenApp for Citrix Receiver for Windows users with domain-joined devices accessing stores through NetScaler Gateway, this setting applies to all users of the store. To enable pass-through authentication for some users and require others to log on to their desktops and applications, you must create separate stores for each group of users. Then, direct your users to the appropriate store for their method of authentication.
- Only one authentication method can be configured for each XenApp Services URL and only one URL is available per store. If you need to enable other types of authentication in addition to smart card authentication, you must create separate stores, each with a XenApp Services URL, for each authentication method. Then, direct your users to the appropriate store for their method of authentication.
- When StoreFront is installed, the default configuration in Microsoft Internet Information Services (IIS) only requires that client certificates are presented for HTTPS connections to the certificate authentication URL of the StoreFront authentication service. IIS does not request client certificates for any other StoreFront URLs. This configuration enables you to provide smart card users with the option to fall back to explicit authentication if they experience any issues with their smart cards. Subject to the appropriate Windows policy settings, users can also remove their smart cards without needing to reauthenticate.

If you decide to configure IIS to require client certificates for HTTPS connections to all StoreFront URLs, the authentication service and stores must be collocated on the same server. You must use a client certificate that is valid for all the stores. With this IIS site configuration, smart card users cannot connect through NetScaler Gateway and cannot fall back to explicit authentication. Users must log on again if they remove their smart cards from their devices.

## Optimize the user experience

January 4, 2019

StoreFront includes features designed to enhance the user experience. These features are configured by default when you create new stores and their associated Citrix Receiver for Web sites, Desktop Appliance sites, and XenApp Services URLs.

### Workspace control

As users move between devices, workspace control ensures that the applications they are using follow them. Users can keep working with the same application instances across multiple devices rather than having to restart all their applications each time they log on to a new device. This enables, for example, clinicians in hospitals to save time as they move from workstation to workstation accessing patient data.

Workspace control is enabled by default for Citrix Receiver for Web sites and connections to stores through XenApp Services URLs. When users log on, they are automatically reconnected to any applications that they left running. For example, consider a user logging on to a store, either through the Citrix Receiver for Web site or the XenApp Services URL, and starting some applications. If the user then logs on to the same store using the same access method but on a different device, the running applications are automatically transferred to the new device. All the applications that the user starts from a particular store are automatically disconnected, but not shut down, when the user logs off from that store. In the case of Citrix Receiver for Web sites, the same browser must be used to log on, start the applications, and log off.

Workspace control for XenApp Services URLs cannot be configured or disabled. For more information about configuring workspace control for Citrix Receiver for Web sites, see [Configure workspace control](#).

Use of workspace control on Citrix Receiver for Web sites is subject to the following requirements and restrictions.

- Workspace control is not available when Citrix Receiver for Web sites are accessed from hosted desktops and applications.
- For users accessing Citrix Receiver for Web sites from Windows devices, workspace control is only enabled if the site can detect that Citrix Receiver is installed on users' devices or if Citrix Receiver for HTML5 is used to access resources.
- To reconnect to disconnected applications, users accessing Citrix Receiver for Web sites through Internet Explorer must add the site to the Local intranet or Trusted sites zones.
- If there is only one desktop available for a user on a Citrix Receiver for Web site that is configured to start single desktops automatically when the user logs on, that user's applications are not

reconnected, regardless of the workspace control configuration.

- Users must disconnect from their applications using the same browser that was originally used to start them. Resources started using a different browser or started locally from the desktop or Start menu using Citrix Receiver cannot be disconnected or shut down by Citrix Receiver for Web sites.

## **Content redirection**

Where users have subscribed to the appropriate application, content redirection enables local files on users' devices to be opened using subscribed applications. To enable redirection of local files, associate the application with the required file types in XenDesktop or XenApp. File type association is enabled by default for new stores. For more information, see [Disable file type association](#).

## **User changed password**

You can enable Citrix Receiver for Web site users logging on with Microsoft Active Directory domain credentials to change their passwords at any time. Alternatively, you can restrict password changes to users whose passwords have expired. This means you can ensure that users are never prevented from accessing their desktops and applications by an expired password.

If you enable Citrix Receiver for Web site users to change their passwords at any time, local users whose passwords are about to expire are shown a warning when they log on. By default, the notification period for a user is determined by the applicable Windows policy setting. Password expiry warnings are only displayed to users connecting from the internal network. For more information about enabling users to change their passwords, see [Configure the authentication service](#).

Users logging on to Desktop Appliance sites can only change expired passwords, even if you enable users to change their passwords at any time. Desktop Appliance sites do not provide controls to enable users to change their passwords after they have logged on.

When you create the authentication service, the default configuration prevents Citrix Receiver for Web site users from changing their passwords, even if the passwords have expired. If you decide to enable this feature, ensure that the policies for the domains containing your servers do not prevent users from changing their passwords. StoreFront must be able to contact the domain controller to change users' passwords.

Enabling users to change their passwords exposes sensitive security functions to anyone who can access any of the stores that use the authentication service. If your organization has a security policy that reserves user password change functions for internal use only, ensure that none of the stores are accessible from outside your corporate network.

## Citrix Receiver for Web site desktop and application views

When both desktops and applications are available from a Citrix Receiver for Web site, the site displays separate desktop and application views by default. Users see the desktop view first when they log on to the site. Regardless of whether applications are also available from a Citrix Receiver for Web site, if only a single desktop is available for a user, the site starts that desktop automatically when the user logs on. You can configure which views appear for your sites and prevent Citrix Receiver for Web sites from automatically starting desktops for users. For more information, see [Configure how resources are displayed for users](#).

The behavior of the views on Citrix Receiver for Web sites depends on the types of resources being delivered. For example, users must subscribe to applications before they appear in the application view, whereas all the desktops available to a user are automatically displayed in the desktop view. For this reason, users cannot remove desktops from the desktop view and cannot reorganize them by dragging and dropping the icons. When desktop restarts are enabled by the XenDesktop administrator, controls that enable users to restart their desktops are provided in the desktop view. If users have access to multiple instances of a desktop from a single desktop group, Citrix Receiver for Web sites differentiate the desktops for users by appending numerical suffixes to the desktop names.

For users connecting to stores within Citrix Receiver or through XenApp Services URLs, the way in which desktops and applications are displayed, and their behavior, is determined by the Citrix client being used.

## Additional recommendations

When delivering applications with XenDesktop and XenApp, consider the following options to enhance the experience for users when they access their applications through your stores. For more information about delivering applications, see [Create a Delivery Group application](#).

- Organize applications into folders to make it easier for users to find what they need when browsing through the available resources. The folders you create in XenDesktop and XenApp appear as categories in Citrix Receiver. You could, for example, group applications according to type or, alternatively, create folders for different user roles in your organization.
- Ensure that you include meaningful descriptions when you deliver applications, as these descriptions are visible to users in Citrix Receiver.
- You can specify that all users have a core set of applications that cannot be removed from the Citrix Receiver home screen by appending the string `KEYWORDS:Mandatory` to the application description. Users can still use the self-service UI to add more applications or remove nonmandatory applications.
- You can automatically subscribe all users of a store to an application by appending the string `KEYWORDS:Auto` to the description you provide when you deliver the application. When users log on to the store, the application is automatically provisioned without users needing to man-

ually subscribe.

- To automatically subscribe all users of a store to a web or software-as-a-service (SaaS) application managed by App Controller, select the App is available in Citrix Receiver to all users automatically check box when you configure the application settings.
- Advertise XenDesktop applications to users or make commonly used applications easier to find by listing them in the Featured list in Citrix Receiver. To do this, append the string KEYWORDS:Featured to the application description.

Note: Multiple keywords must be separated by spaces only; for example, KEYWORDS:Auto Featured.

- By default, XenDesktop and XenApp hosted shared desktops are treated like other desktops by Citrix Receiver for Web sites. To change this behavior, append the string KEYWORDS:TreatAsApp to the desktop description. The desktop is displayed in the application views of Citrix Receiver for Web sites rather than the desktop views and users are required to subscribe before they can access the desktop. In addition, the desktop is not automatically started when the user logs on to the Citrix Receiver for Web site and is not accessed with the Desktop Viewer, even if the site is configured to do this for other desktops.
- For Windows users, you can specify that the locally installed version of an application should be used in preference to the equivalent delivered instance if both are available. To do this, append the string **KEYWORDS:prefer="application"** to the application description, where application is either one or more complete words in the name of the local application as given by the shortcut file name, or the absolute path including the executable file name to the local application from the \Start Menu folder. When a user subscribes to an application with this keyword, Citrix Receiver searches for the specified name or path on the user's device to determine whether the application is already installed locally. If the application is found, Citrix Receiver subscribes the user to the delivered application, but does not create a shortcut. When the user starts the delivered application from Citrix Receiver, the locally installed instance runs instead. For more information, see [Configure application delivery](#).

## StoreFront high availability and multi-site configuration

October 15, 2018

StoreFront includes a number of features that combine to enable load balancing and failover between the deployments providing resources for stores. You can also specify dedicated disaster recovery deployments for increased resiliency. These features enable you to configure StoreFront deployments distributed over multiple sites to provide high availability for your stores. For more information, see [Set up highly available multi-site store configurations](#).

## Resource aggregation

By default, StoreFront enumerates all the deployments providing desktops and applications for a store and treats all those resources as distinct. This means that if the same resource is available from several deployments, users see an icon for each resource, which might be confusing if the resources have the same name. When you set up highly available multi-site configurations, you can group XenDesktop and XenApp deployments that deliver the same desktop or application so that identical resources can be aggregated for users. Grouped deployments do not need to be identical, but resources must have the same name and path on each server to be aggregated.

When a desktop or application is available from multiple XenDesktop and XenApp deployments configured for a particular store, StoreFront aggregates all instances of that resource and presents users with a single icon. App Controller applications cannot be aggregated. When a user starts an aggregated resource, StoreFront determines the most appropriate instance of that resource for the user on the basis of server availability, whether the user already has an active session, and the ordering you specified in your configuration.

StoreFront dynamically monitors servers that fail to respond to requests on the basis that such servers are either overloaded or temporarily unavailable. Users are directed to resource instances on other servers until communications are re-established. Where supported by the servers providing the resources, StoreFront attempts to reuse existing sessions to deliver additional resources. If a user already has an active session on a deployment that also provides the requested resource, StoreFront reuses the session if it is compatible with that resource. Minimizing the number of sessions for each user reduces the time taken to start additional desktops or applications and can allow for more efficient use of product licenses.

After checking for availability and existing user sessions, StoreFront uses the ordering specified in your configuration to determine the deployment to which the user is connected. If multiple equivalent deployments are available to the user, you can specify that users are connected either to the first available deployment or randomly to any deployment in the list. Connecting users to the first available deployment enables you to minimize the number of deployments in use for the current number of users. Randomly connecting users provides a more even distribution of users across all the available deployments.

You can override the specified deployment ordering for individual XenDesktop and XenApp resources to define preferred deployments to which users are connected when they access a particular desktop or application. This enables you to, for example, specify that users are preferentially connected to a deployment specifically adapted to deliver a particular desktop or application, but use other deployments for other resources. To do this, append the string `KEYWORDS:Primary` to the description of the desktop or application on the preferred deployment and `KEYWORDS:Secondary` to the resource on other deployments. Where possible, users are connected to the deployment providing the primary resource, regardless of the deployment ordering specified in your configuration. Users are connected to deployments providing secondary resources when the preferred deployment is unavailable.

## Map users to resources

By default, users accessing a store see an aggregate of all the resources available from all the deployments configured for that store. To provide different resources for different users, you can configure separate stores or even separate StoreFront deployments. However, when you set up highly available multi-site configurations, you can provide access to particular deployments on the basis of users' membership of Microsoft Active Directory groups. This enables you to configure different experiences for different user groups through a single store.

For example, you can group common resources for all users on one deployment and finance applications for the Accounts department on another deployment. In such a configuration, a user who is not a member of the Accounts user group sees only the common resources when accessing the store. A member of the Accounts user group is presented with both the common resources and the finance applications.

Alternatively, you can create a deployment for power users that provides the same resources as your other deployments, but with faster and more powerful hardware. This enables you to provide an enhanced experience for business-critical users, such as your executive team. All users see the same desktops and applications when they log on to the store, but members of the Executives user group are preferentially connected to resources provided by the power user deployment.

## Subscription synchronization

If you enable your users to access the same applications from similar stores in different StoreFront deployments, users' application subscriptions must be synchronized between the server groups. Otherwise, users who subscribe to an application in a store on one StoreFront deployment might need to resubscribe to the application when they log on to a different server group. To provide a seamless experience for users moving between separate StoreFront deployments, you can configure periodic synchronization of users' application subscriptions between stores in different server groups. Choose between regular synchronization at a specific interval or schedule synchronization to occur at particular times throughout the day. For more information, see [Configure subscription synchronization](#).

## Dedicated disaster recovery resources

You can configure specific disaster recovery deployments that are not used unless all other deployments are unavailable. Typically, disaster recovery deployments are not collocated with the main deployments, provide only a subset of the resources that are normally available, and might offer a degraded user experience. When you specify that a deployment is to be used for disaster recovery, the deployment will not be used for load balancing or failover. Users cannot access desktops and applications provided by disaster recovery deployments unless all the other deployments for which the disaster recovery deployments are configured become unavailable.

When access to any other deployment is re-established, users cannot start more disaster recovery resources, even if they are already using such a resource. Users running disaster recovery resources are not disconnected from those resources when access to other deployments is restored. However, they cannot start disaster recovery resources again once they have exited these resources. Similarly, StoreFront does not attempt to reuse existing sessions with disaster recovery deployments if any other deployments have subsequently become available.

### **Optimal NetScaler Gateway routing**

If you have configured separate NetScaler Gateway appliances for your deployments, StoreFront enables you to define the optimal appliance for users to access each of the deployments providing resources for a store. For example, if you create a store that aggregates resources from two geographical locations, each with a NetScaler Gateway appliance, users connecting through an appliance in one location can start a desktop or application in the other location. However, by default, the connection to the resource is then routed through the appliance to which the user originally connected and must therefore traverse the corporate WAN.

To improve the user experience and reduce network traffic over the WAN, you can specify the optimal NetScaler Gateway appliance for each of your deployments. With this configuration, user connections to resources are automatically routed through the appliance local to the deployment providing the resources, regardless of the location of the appliance through which the user accesses the store.

Optimal NetScaler Gateway routing can also be used in the special case where local users on the internal network are required to log on to NetScaler Gateway for endpoint analysis. With this configuration, users connect to the store through the NetScaler Gateway appliance, but there is no need to route the connection to the resource through the appliance as the user is on the internal network. In this case, you enable optimal routing, but do not specify an appliance for the deployment, so user connections to desktops and applications are routed directly and not through NetScaler Gateway. Note that you must also configure a specific internal virtual server IP address for the NetScaler Gateway appliance. Additionally, specify an inaccessible internal beacon point so that Citrix Receiver is always prompted to connect to NetScaler Gateway, regardless of the user's network location.

### **NetScaler Gateway global server load balancing**

StoreFront supports NetScaler Gateway deployments configured for global server load balancing with multiple appliances configured with a single fully qualified domain name (FQDN). For user authentication and to route user connections through the appropriate appliance, StoreFront must be able to distinguish between the appliances. Because the appliance FQDN cannot be used as a unique identifier in a global server load balancing configuration, you must configure StoreFront with unique IP addresses for each of the appliances. Typically, this is the IP address of the NetScaler Gateway virtual server.

For information about load balancing, see [Load balancing with NetScaler](#).

## Important considerations

When you decide whether to set up highly available multi-site configurations for your stores, consider the following requirements and restrictions.

- Desktops and applications must have the same name and path on each server to be aggregated. In addition, the properties of aggregated resources, such as names and icons, must be the same. If this is not the case, users could see the properties of their resources change when Citrix Receiver enumerates the available resources.
- Assigned desktops, both pre-assigned and assigned-on-first-use, should not be aggregated. Ensure that Delivery Groups providing such desktops do not have the same name and path in sites that you configure for aggregation.
- App Controller applications cannot be aggregated.
- If you configure synchronization of users' application subscriptions between stores on separate StoreFront deployments, the stores must have the same name in each server group. In addition, both server groups must reside within the Active Directory domain containing your users' accounts or within a domain that has a trust relationship with the user accounts domain.
- StoreFront only provides access to backup deployments for disaster recovery when all the primary sites in the equivalent deployment set are unavailable. If a backup deployment is shared between multiple equivalent deployment sets, all the primary sites in each of the sets must be unavailable before users can access the disaster recovery resources.

## Install, set up, upgrade, and uninstall

February 25, 2021

### Warning

The StoreFront management console does not open after an upgrade to StoreFront 3.12.1000 (XenApp and XenDesktop 7.15 LTSR CU1) from StoreFront 3.12 (XenApp and XenDesktop 7.15 LTSR), or after an install of StoreFront 3.12.1000. The StoreFront management console displays the error "MMC could not create the snap-in. The snap-in might not have been installed correctly." To work around this issue, follow the steps described in [CTX233206](#).

### Before installing and configuring

To install and configure StoreFront, complete the following steps in order:

1. If you plan to use StoreFront to deliver XenDesktop and XenApp resources to users, ensure that the StoreFront server is joined to either the Microsoft Active Directory domain containing your users' accounts or a domain that has a trust relationship with the user accounts domain.

**Important:**

- For single server deployments you can install StoreFront on a non-domain-joined server.
  - StoreFront cannot be installed on a domain controller.
2. If not already present, StoreFront requires Microsoft .NET 4.5 Framework, which can be downloaded from Microsoft. You must have Microsoft .NET 4.5 installed before you can install StoreFront.
  3. Optionally, if you plan to configure a multiple server StoreFront deployment, set up a load balancing environment for your StoreFront servers.

To use NetScaler for load balancing, you define a virtual server to proxy your StoreFront servers. For more information on configuring NetScaler for load balancing, see [Load balancing with NetScaler](#).

- a) Ensure that load balancing is enabled on your NetScaler appliance.
  - b) For each StoreFront server, create individual HTTP or TLS load balancing services, as appropriate, using the StoreFront monitor type.
  - c) Configure the services to insert the client IP address into the X-Forwarded-For HTTP header of requests forwarded to StoreFront, overriding any global policies.  
StoreFront requires users' IP addresses to establish connections to their resources.
  - d) Create a virtual server and bind the services to the virtual server.
  - e) On the virtual server, configure persistence using the cookie insert method if you have the latest Citrix Receivers installed on all platforms and you have no need to support Android; otherwise, configure persistence on the basis of source IP address. Ensure the Time To Live (TTL) is sufficient to enable users to stay logged on to the server as long as required.  
Persistence ensures that only the initial user connection is load balanced, after which subsequent requests from that user are directed to the same StoreFront server.
4. Optionally, enable the following features.
    - .NET Framework 4.5 Features > .NET Framework 4.5, ASP.NET 4.5

Optionally, enable the following roles and their dependencies on the StoreFront server.

- Web Server (IIS) > Web Server > Common HTTP Features > Default Document, HTTP Errors, Static Content, HTTP Redirection
- Web Server (IIS) > Web Server > Health and Diagnostics > HTTP Logging

- Web Server (IIS) > Web Server > Security > Request Filtering, Windows Authentication
- On Windows Server 2012 servers:  
Web Server (IIS) > Web Server > Application Development > .NET Extensibility 4.5, Application Initialization, ASP.NET 4.5, ISAPI Extensions, ISAPI Filters  
On Windows Server 2008 R2 servers:  
Web Server (IIS) > Web Server > Application Development > .NET Extensibility, Application Initialization, ASP.NET, ISAPI Extensions, ISAPI Filters
- Web Server (IIS) > Management Tools > IIS Management Console, IIS Management Scripts and Tools

The StoreFront installer checks that all the features and server roles above are enabled.

#### 5. Install StoreFront.

If you intend the server to be part of a server group, both the StoreFront installation location and IIS website settings, physical path and site IDs must be consistent across them.

6. Optionally, configure Microsoft Internet Information Services (IIS) for HTTPS if you plan to use HTTPS to secure communications between StoreFront and users' devices.

HTTPS is required for smart card authentication. By default, Citrix Receiver requires HTTPS connections to stores. You can change from HTTP to HTTPS at any time after installing StoreFront, provided the appropriate IIS configuration is in place.

To configure IIS for HTTPS, use the Internet Information Services (IIS) Manager console on the StoreFront server to create a server certificate signed by your domain certification authority. Then, add HTTPS binding to the default website. For more information about creating a server certificate in IIS, see [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637(v=ws.11)). For more information about adding HTTPS binding to an IIS site, see [https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632(v=ws.11)).

7. Ensure your firewalls and other network devices permit access to TCP port 80 or 443, as appropriate, from both inside and outside the corporate network. In addition, ensure that any firewalls or other devices on your internal network do not block traffic to any of the unassigned TCP ports.

When you install StoreFront, a Windows Firewall rule is configured enabling access to the StoreFront executable through a TCP port randomly selected from all unreserved ports. This port is used for communications between the StoreFront servers in a server group.

8. If you plan to use multiple Internet Information Services (IIS) websites, after creating the websites in IIS, use the PowerShell SDK to create a StoreFront deployment in each of those IIS websites. For more information, see [Multiple Internet Information Services \(IIS\) websites](#).

**Note:** StoreFront disables the management console when it detects multiple sites and displays a message to that effect.

9. Use the Citrix StoreFront management console to [configure your server](#).

## Install StoreFront

### Important

- To avoid potential errors and data loss when installing StoreFront, ensure all applications are closed and no other tasks or operations are running on the target system.
- From StoreFront 3.12.6000 onwards, to install StoreFront in a custom location for the first time, you must install from the command prompt using the -INSTALLDIR argument to specify the location. See [To install StoreFront at a command prompt](#).

1. Download the installer from the download page.
2. Log on to the StoreFront server using an account with local administrator permissions.
3. Ensure that the required Microsoft .NET 4.5 Framework is installed on the server.
4. Browse the download package, locate CitrixStoreFront-x64.exe, and run the file as an administrator.

Note: On Windows Server 2008 R2 servers, a message may be displayed indicating that the .NET feature will be enabled. If this message appears, click Yes.

5. Read and accept the license agreement, and click Next.
6. If the Review prerequisites page appears, click Next.
7. On the Ready to install page, check the prerequisites and StoreFront components that are listed for installation and click Install.

Before the components are installed, the following roles are enabled if they are not already configured on the server.

- Web Server (IIS) > Web Server > Common HTTP Features > Default Document, HTTP Errors, Static Content, HTTP Redirection
- Web Server (IIS) > Web Server > Health and Diagnostics > HTTP Logging
- Web Server (IIS) > Web Server > Security > Request Filtering, Windows Authentication
- On Windows Server 2012 servers:

Web Server (IIS) > Web Server > Application Development > .NET Extensibility 4.5, Application Initialization, ASP.NET 4.5, ISAPI Extensions, ISAPI Filters

On Windows Server 2008 R2 servers:

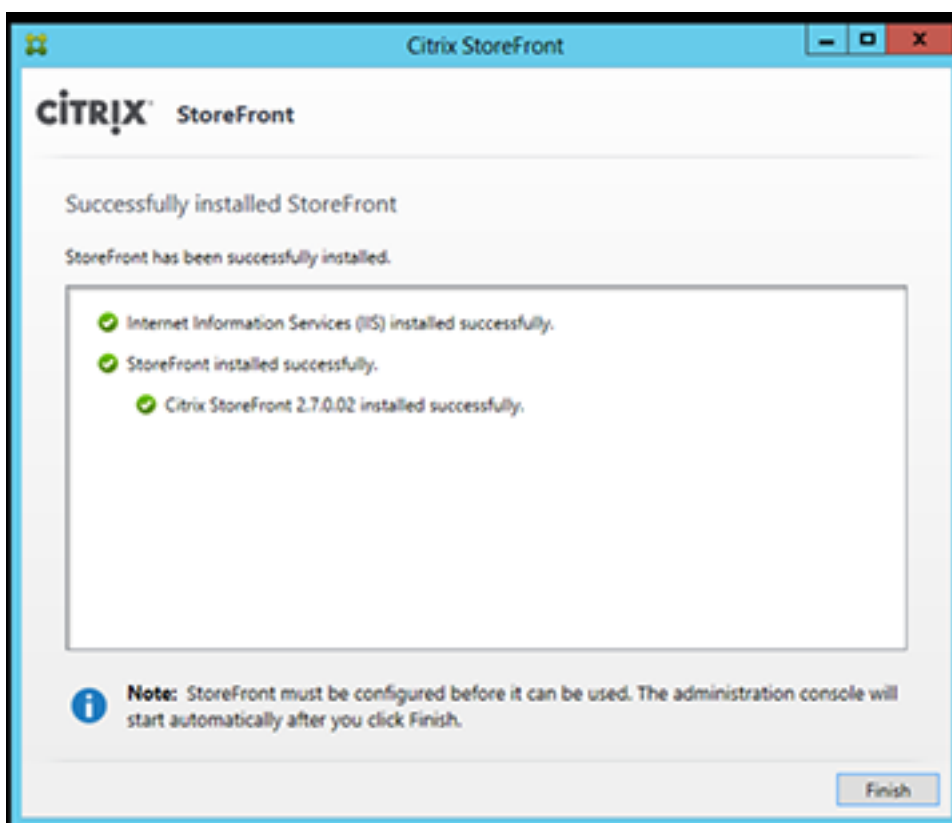

Web Server (IIS) > Web Server > Application Development > .NET Extensibility, Application Initialization, ASP.NET, ISAPI Extensions, ISAPI Filters

- Web Server (IIS) > Management Tools > IIS Management Console, IIS Management Scripts and Tools

The following features are also enabled if they are not already configured.

- .NET Framework 4.5 Features > .NET Framework 4.5, ASP.NET 4.5

8. When the installation is complete, click Finish. The Citrix StoreFront management console starts automatically. You can also open StoreFront from the Start screen.

**Note:**

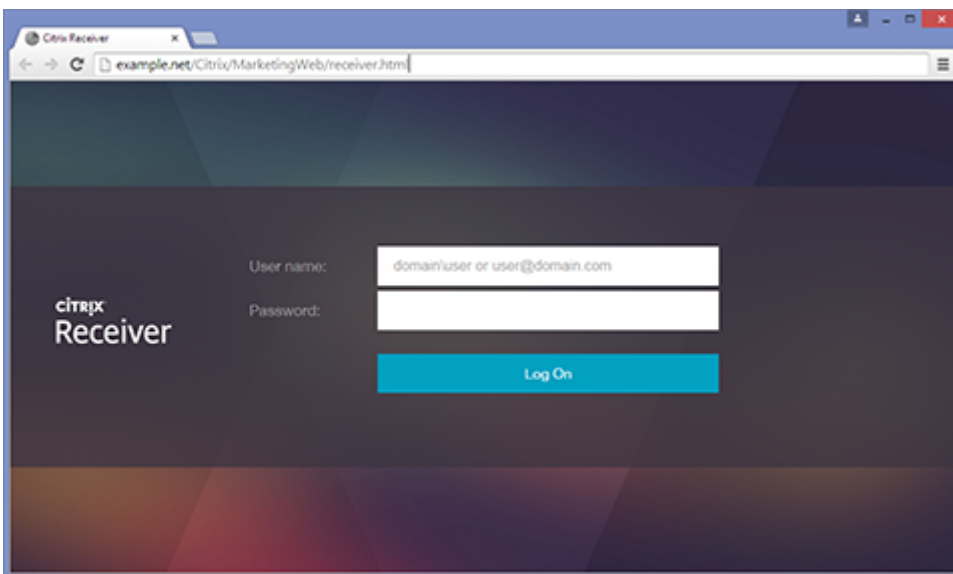

From StoreFront 3.12.6000 onwards a restart is required after StoreFront installation.

9. In the Citrix Storefront management console, click Create a new deployment.
  - a) Specify the URL of the StoreFront server in the **Base URL** box.
  - b) On the **Store Name** page, specify a name for your store, and click Next.
10. On the **Delivery Controllers** page, list the infrastructure – the details of the XenApp or XenDesktop services - that is providing the resources you want to make available in the store. You can enter a “dummy” server here; however, no apps will display in the store.

11. Set the **Transport type** and the **Port**. You can specify HTTP and port 443 and click **OK**. Alternatively, copy settings from an existing Web Interface or StoreFront deployment.
12. On the **Remote Access** page, select None. If you are using NetScaler Gateway, select No VPN Tunnel and enter your gateway details.
13. On the **Remote Access** page, select Create. Once the store has been created, click Finish.

Your store is now available for users to access through the Citrix Receiver for Web site, which enables users to access their desktops and apps through a webpage.

The URL for users to access the Citrix Receiver for Web site for the new store is displayed. For example: `example.net/Citrix/MarketingWeb/`. Log on and you will access the new user interface in Citrix Receiver.

## CEIP

If you participate in the Citrix Customer Experience Improvement Program (CEIP), anonymous statistics and usage information are sent to Citrix to improve the quality and performance of Citrix products.

By default, you are automatically enrolled in CEIP when you install StoreFront. The first upload of data occurs approximately seven days after you install StoreFront. You can change this default in a registry setting. If you change the registry setting before installing StoreFront, that value will be used. If you change the registry setting before upgrading StoreFront, that value will be used.

### Warning

Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry

before you edit it.

Registry setting that controls automatic upload of analytics (default = 1):

Location: HKLM:\Software\Citrix\Telemetry\CEIP

Name: Enabled

Type: REG\_DWORD

Value: 0 = disabled, 1 = enabled

By default, the “Enabled” property is hidden in the registry. When it remains unspecified, the automatic upload feature is enabled.

Using PowerShell, the following cmdlet disables enrollment in CEIP:

```
New-ItemProperty -Path HKLM:\SOFTWARE\Citrix\Telemetry\CEIP -Name Enabled -PropertyType  
DWORD -Value 0
```

**Note:** The registry setting controls the automatic upload of anonymous statistics and usage information for all components on the same server. For example, if you have installed StoreFront on the same server as the Delivery Controller and decide to opt out of CEIP using the registry setting, the opt out will apply to both components.

### CEIP data collected from StoreFront

The following table gives examples of the type of anonymous information collected. The data does not contain any details that identify you as a customer.

Data	Description
StoreFront version	String denoting the installed version of Storefront. For example, “3.8.0.0”
Stores count	A counter for the number of Stores in the deployment.
Server Count in server group	A counter for the number of Servers in the Server group.
Delivery Controller Count per store	List of numeric values indicating the number of Delivery Controllers available for each Store in the Deployment.
HTTPS enabled	String denoting whether https is enabled for the deployment. “True” or “False”.
Classic experience enabled for Citrix Receiver	List of Booleans denoting whether “Classic Experience” is enabled for each Web Receiver. TRUE or FALSE for each Web Receiver.

Data	Description
HTML5 setting for Citrix Receiver	List of Strings denoting the HTML5 Receiver setting for each Web Receiver. “Always”, “Fallback”, “Off” for each Web Receiver.
Workspace control enabled for Citrix Receiver	List of Booleans denoting whether “Workspace Control” is enabled for each Web Receiver. TRUE or FALSE for each Web Receiver.
Remote Access enabled for store	List of Strings denoting whether “Remote Access” is enabled for each Store in the Deployment. “ENABLED” or “DISABLED” for each store.
Gateways count	A counter for the number of NetScaler Gateways configured in the deployment.

### To install StoreFront at a command prompt

1. Log on to the StoreFront server using an account with local administrator permissions.
2. Ensure that all of the requirements for installation of StoreFront are met before installing StoreFront. Refer to [Before installing and configuring](#) for details.
3. Browse your installation media or download package, locate CitrixStoreFront-x64.exe, and copy the file to a temporary location on the server.
4. At a command prompt, navigate to the folder containing the installation file and type the following command.

```

1 CitrixStoreFront-x64.exe [-silent] [-INSTALLDIR
   installationlocation]
2 [-WINDOWS_CLIENT filelocation\filename.exe]
3 [-MAC_CLIENT filelocation\filename.dmg]
4 <!--NeedCopy-->

```

Use the `-silent` argument to perform a silent installation of StoreFront and all the prerequisites. By default, StoreFront is installed at `C:\Program Files\Citrix\Receiver StoreFront\`. However, you can specify a different installation location using the `-INSTALLDIR` argument, where `installationlocation` is the directory in which to install StoreFront. Note that if you intend the server to be part of a server group, both the StoreFront installation location and IIS website settings, physical path and site IDs must be consistent across them.

By default, if a Citrix Receiver for Web site cannot detect Citrix Receiver on a Windows or Mac OS

X device, the user is prompted to download and install the appropriate Citrix Receiver for their platform from the Citrix website. You can modify this behavior so that users download the Citrix Receiver installation files from the StoreFront server instead. For more information, see [Make Citrix Receiver installation files available on the server](#).

If you plan to make this configuration change, specify the `-WINDOWS_CLIENT` and `-MAC_CLIENT` arguments to copy Citrix Receiver for Windows and Citrix Receiver for Mac installation files, respectively, to the appropriate location in your StoreFront deployment. Replace filelocation with the directory containing the installation file that you want to copy and filename with the name of the Citrix Receiver installation file. Citrix Receiver for Windows and Citrix Receiver for Mac installation files are included on your StoreFront installation media or download package.

## Upgrade StoreFront

To upgrade existing StoreFront 2.0 through 3.x deployments to this version of StoreFront, run the installation file for this version of StoreFront. Releases before StoreFront 2.0 cannot be upgraded directly. Instead, you must first upgrade StoreFront 1.2 to StoreFront 2.0 before upgrading to this StoreFront. Similarly, you cannot upgrade Storefront 1.1 to this StoreFront directly. You must upgrade Storefront 1.1 to StoreFront 1.2 and then again to StoreFront 2.0 before finally upgrading to this StoreFront.

Once the upgrade process is started, it cannot be rolled back. If the upgrade is interrupted or cannot be completed, the existing configuration is removed but StoreFront is not installed. Before starting to upgrade, you must disconnect users from the StoreFront deployment and prevent users from accessing the servers while the upgrade is in progress. This ensures that all StoreFront files are accessible by the installer during the upgrade. If any files cannot be accessed by the installer, they cannot be replaced and so the upgrade will fail, resulting in the removal of the existing StoreFront configuration. StoreFront does not support multiple server deployments containing different product versions, so all servers in a group must be updated to the upgraded version before granting access to the deployment. Concurrent upgrade is not supported for multiple server deployments, servers must be upgraded sequentially. Citrix recommends that you back up your data before upgrading.

Uninstalling StoreFront removes the authentication service, stores, users' application subscriptions, Citrix Receiver for Web sites, Desktop Appliance sites, and XenApp Services URLs. This means that if you decide to uninstall StoreFront, you must manually recreate your services, stores, and sites when you reinstall StoreFront. Upgrading also enables you to preserve your StoreFront configuration and leaves users' application subscription data intact so that users do not need to resubscribe to all of their applications.

Upgrading the operating system version on a server running StoreFront is not supported. Citrix recommends that you install StoreFront on a new installation of the operating system.

**Important**

Before you start the upgrade:

- Close all other applications on the StoreFront server.
- Close all command line and PowerShell windows.
- If you have made modifications to files in `C:\inetpub\wwwroot\Citrix\, such as default.ica and usernamepassword.tfrm, back them up for each store. After the upgrade you can restore them to reinstate your modifications.`

**\*\*To upgrade existing StoreFront 2.0 through 3.x to this version of StoreFront \*\***

1. Disable access to the deployment through the load balancing environment. Disabling the load balancing URL prevents users from connecting to the deployment during the upgrade process.
2. Back up all the servers in the server group.
3. Remove one of the servers from the existing server group.
4. Restart the server you removed.  
Note that you can use a parallel load balancer to check the new server group as you build it. The variant that maximizes availability and further minimizes risk involves removing and upgrading only one server from the original server group. You can then build the new group out of new machines rather than machines taken out of the original server group.
5. Upgrade the server you removed using an admin account with no other installations running and a minimum of other applications.
6. Check that the server you removed has upgraded successfully.
7. Remove another one of the servers in the existing server group from the load balancer.
8. Restart the server you removed for the same reasons noted in Step 1.
9. Uninstall the currently installed version of StoreFront and install the new version of StoreFront.
10. Join the newly installed server into a new server group consisting of all the upgraded servers and the freshly installed servers, and check they are functioning correctly.
11. Repeat Steps 3-10 until the new server group has sufficient capacity to take over from the old server group, point the load balancer at the new server group, and check that it is functioning correctly.
12. Repeat Steps 3-10 for the remaining servers, adding each one to the load balancer after each successful upgrade.

**Note**

- If you want to maximize availability, you can maintain access to the original server group during the upgrade process until the new server group becomes available. To do this;
  1. Skip Step 1.
  2. Modify Step 11 to include disabling access to the original server group using the load balancer. Export subscription data from the original server group and import it into

the new server group. Enable access to the new server group using the load balancer.

This ensures that any subscription changes made by users after Step 3 and before Step 11 are available in the new server group.

- You can further maximize availability by removing only one server from the original server group and upgrading it, and then building the new server group using new servers rather than servers removed from the original server group. When the new server group is in production, you can retire the old servers.
- Upgrades from StoreFront 2.x to 3.x followed by a propagation to the server group might result in an entry for the pnaAuthenticationStartupModule being added to the authentication configuration file. Because entries can be added only to authentication services that have been enabled for PNA authentication services and PNA password change, the authentication service cannot start, as it's missing the named start-up module. To work around this issue, remove the entry from the authentication configuration file. By default, the configuration file resides at C:\inetpub\wwwroot\Citrix\\web.config.
- Save backups of the web.config file in a **different** location from the default IIS directory of the store. Do not save backups in, for example, C:\inetpub\wwwroot\citrix\

## Configure StoreFront

### Note:

During installation and upgrade, members of the local admin group are copied to an internal CitrixStoreFrontAdministrators group. This gives users who already belonged to the local admin group, when StoreFront was last installed or upgraded, the ability to use the StoreFront management console to configure StoreFront server groups and perform related propagation and replication tasks. If you later add users to the local admin group, you must manually copy them to the CitrixStoreFrontAdministrators group before they can use the StoreFront management console to configure StoreFront server groups and perform related propagation and replication tasks. If you add a currently logged in user to the CitrixStoreFrontAdministrators group, they need to log out and log in again to use the StoreFront management console.

When the Citrix StoreFront management console first starts, two options are available.

- [Create a new deployment](#). Configure the first server in a new StoreFront deployment. Single-server deployments are ideal for evaluating StoreFront or for small production deployments. Once you have configured your first StoreFront server, you can add more servers to the group at any time to increase the capacity of your deployment.
- [Join existing server group](#). Add another server to an existing StoreFront deployment. Select this option to rapidly increase the capacity of your StoreFront deployment. External load balancing

is required for multiple server deployments. To add a new server, you will need access to an existing server in the deployment.

## Uninstall StoreFront

In addition to the product itself, uninstalling StoreFront removes the authentication service, stores, Citrix Receiver for Web sites, Desktop Appliance sites, and XenApp Services URLs, and their associated configurations. The subscription store service containing users' application subscription data is also deleted. In single-server deployments, this means that details of users' application subscriptions are lost. However, in multiple server deployments these data are retained on other servers in the group. Prerequisites enabled by the StoreFront installer, such as the .NET Framework features and the Web Server (IIS) role services, are not removed from the server when StoreFront is uninstalled.

1. Log on to the StoreFront server using an account with local administrator permissions.
2. On the Windows **Start** screen or Apps screen, locate the **Citrix StoreFront** tile. Right-click the tile and click **Uninstall**.
3. In the **Programs and Features** dialog box, select **Citrix StoreFront** and click **Uninstall** to remove all StoreFront components from the server.
4. In the **Uninstall Citrix StoreFront** dialog box, click **Yes**. When the uninstallation is complete, click **OK**.

## Create a new deployment

May 4, 2021

1. If the Citrix StoreFront management console is not already open after installation of StoreFront, on the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. In the results pane of the Citrix StoreFront management console, click Create a new deployment.
3. Specify the URL of the StoreFront server or the load balancing environment for a multiple server deployment in the Base URL box.

If you have not yet set up your load balancing environment, enter the server URL. You can modify the base URL for your deployment at any time.

You can change from HTTP to HTTPS at any time using the Change Base URL task in the StoreFront management console, provided that Microsoft Internet Information Services (IIS) is configured for HTTPS.

4. Click Next to set up the authentication service, which authenticates users to Microsoft Active Directory.

To use HTTPS to secure communications between StoreFront and users' devices, you must configure Microsoft Internet Information Services (IIS) for HTTPS. In the absence of the appropriate IIS configuration, StoreFront uses HTTP for communications.

By default, Citrix Receiver requires HTTPS connections to stores. If StoreFront is not configured for HTTPS, users must carry out additional configuration steps to use HTTP connections. HTTPS is required for smart card authentication. You can change from HTTP to HTTPS at any time after configuring StoreFront, provided the appropriate IIS configuration is in place. For more information, see [Configure server groups](#).

You can change from HTTP to HTTPS at any time using the **Change Base URL** task in the StoreFront management console, provided that Microsoft Internet Information Services (IIS) is configured for HTTPS.

5. On the Store Name page, specify a name for your store, whether you want to allow only unauthenticated (anonymous) users access to the store, and click Next.

StoreFront stores aggregate desktops and applications, making them available to users. Store names appear in Citrix Receiver under users' accounts, so choose a name that gives users information about the content of the store.

6. On the Controllers page, list the infrastructure providing the resources that you want to make available in the store. To add desktops and applications to the store, follow the appropriate procedure below. You can configure stores to provide resources from any mixture of XenDesktop, XenApp and XenMobile (App Controller) deployments. Repeat the procedures, as necessary, to add all the deployments providing resources for the store.

- Add XenDesktop and XenApp resources to the store
- Add App Controller applications to the store

7. When you have added all the required resources to the store, on the Controllers page, click Next.

8. On the Remote Access page, specify whether and how users connecting from public networks can access the internal resources.

- To make the store available to users on public networks, check the **Enable remote access** box. If you leave this box unchecked, only local users on the internal network are able to access the store.
- To make only resources delivered through the store available through NetScaler Gateway, select **Allow users to access only resources delivered through StoreFront (No VPN tunnel)**.
- To make the store and all other resources on the internal network available through a Secure Sockets Layer (SSL) virtual private network (VPN) tunnel, select **Allows users to access all resources on internal network (Full VPN tunnel)**. Users might require the NetScaler Gateway Plug-in to establish the VPN tunnel.

If you configure remote access to the store through NetScaler Gateway, the pass-through from NetScaler Gateway authentication method is automatically enabled. Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores.

9. If you enabled remote access, list the NetScaler Gateway deployments through which users can access the store. To add a NetScaler Gateway deployment, follow the appropriate procedure below. Repeat the procedures, as necessary, to add further deployments.
  - Provide remote access to the store through a NetScaler Gateway appliance
  - Provide remote access to the store through an Access Gateway 5.0 cluster
10. When you have added all your NetScaler Gateway deployments, select from the NetScaler Gateway appliances list the deployments through which users can access the store. If you enable access through multiple deployments, specify the default deployment to be used to access the store. Click **Next**.
11. On the **Authentication Methods** page, select the methods your users will use to authenticate to the store and click **Next**. You can select from the following methods:
  - **Username and password:** Users enter their credentials and are authenticated when they access their stores.
  - **SAML Authentication:** Users authenticate to an Identity Provider and are automatically logged on when they access their stores.
  - **Domain passthrough†:** Users authenticate to their domain-joined Windows computers and their credentials are used to log them on automatically when they access their stores.
  - **Smart card†:** Users authenticate using smart cards and PINs when they access their stores.
  - **HTTP basic:** Users authenticate with the StoreFront server's IIS web server.
  - **Passthrough through NetScaler Gateway:** Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores. This is automatically checked when the remote access is enabled.

**Note:**

† Store authentication methods which do not propagate to the store's Citrix Receiver for Web sites. Configure these authentication methods independently for each Citrix Receiver for Web site using the **Manage Receiver for Web Sites** task described in [Configure Citrix Receiver for Web sites](#).

The other store authentication methods described here do propagate to the store's Citrix Receiver for Web sites. (That is, a selection or deselection made here for the store dictates the setting used by all its Receiver for Web sites.)

12. On the **XenApp Services URL** page, configure the XenApp Service URL for users who use PNAgent to access the applications and desktops.

13. After creating the store, further options become available in the Citrix StoreFront management console. For more information, see the [various management articles](#).

Your store is now available for users to access with Citrix Receiver, which must be configured with access details for the store. There are a number of ways in which you can provide these details to users to make the configuration process easier for them. For more information, see [User access options](#).

Alternatively, users can access the store through the Citrix Receiver for Web site, which enables users to access their desktops and applications through a webpage. The URL for users to access the Citrix Receiver for Web site for the new store is displayed when you create the store.

When you create a new store, the XenApp Services URL is enabled by default. Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with users who have older Citrix clients that cannot be upgraded, can access stores directly using the XenApp Services URL for the store. The XenApp Services URL has the form `http[s]://serveraddress/Citrix/storename/PNAgent/config.xml` where `serveraddress` is the fully qualified domain name of the server or load balancing environment for your StoreFront deployment and `storename` is the name you specified for the store in Step 5.

You can quickly add more servers to your deployment by selecting the option to [join an existing server group](#) when installing further instances of StoreFront.

### **Add XenDesktop and XenApp resources to the store**

Complete the following steps to make desktops and applications provided by XenApp and XenDesktop available in the store that you create as part of the initial configuration of your StoreFront server. It is assumed that you have completed Steps 1 to 6 in the “Create a new deployment” procedure at the top of this article.

1. On the Controllers page of the StoreFront console Create Store UI, click Add.
2. In the Add Controllers dialog box, specify a name that will help you to identify the deployment and indicate whether the resources that you want to make available in the store are provided by XenDesktop, XenApp, or XenMobile.
3. Add the names or IP addresses of your servers to the Servers list. Specify multiple servers to enable fault tolerance, listing the entries in order of priority to set the failover sequence. For XenDesktop sites, give details of Controllers. In the case of XenApp farms, list servers running the Citrix XML Service.
4. Select from the Transport type list the type of connections for StoreFront to use for communications with the servers.
  - To send data over unencrypted connections, select HTTP. If you select this option, you must make your own arrangements to secure connections between StoreFront and your servers.

- To send data over secure HTTP connections using Secure Sockets Layer (SSL) or Transport Layer Security (TLS), select HTTPS. If you select this option for XenDesktop and XenApp servers, ensure that the Citrix XML Service is set to share its port with Microsoft Internet Information Services (IIS) and that IIS is configured to support HTTPS.
- To send data over secure connections to XenApp servers using the SSL Relay to perform host authentication and data encryption, select SSL Relay.

Note: If you are using HTTPS or the SSL Relay to secure connections between StoreFront and your servers, ensure that the names you specify in the Servers list match exactly (including the case) the names on the certificates for those servers.

5. Specify the port for StoreFront to use for connections to the servers. The default port is 80 for connections using HTTP and the SSL Relay, and 443 for HTTPS connections. In the case of XenDesktop and XenApp servers, the specified port must be the port used by the Citrix XML Service.

In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Delivery Controllers by specifying a key. For information about key generation, see [Manage security keys](#).

In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For information about key generation, see [Manage security keys](#).

6. If you are using the SSL Relay to secure connections between StoreFront and XenApp servers, specify the TCP port of the SSL Relay in the SSL Relay port box. The default port is 443. Ensure that all the servers running the SSL Relay are configured to monitor the same port.

You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and XenMobile deployments. To add further XenDesktop sites or XenApp farms, repeat the procedure above. To make applications managed by App Controller available in the store, follow the steps in Add App Controller applications to the store. When you have added all the required resources to the store, return to Step 7 in the “Create a new deployment” procedure at the top of this article.

### Add App Controller applications to the store

Complete the following steps to make applications managed by App Controller available in the store that you create as part of the initial configuration of your StoreFront server. It is assumed that you have completed Steps 1 to 6 in the “Create a new deployment” procedure at the top of this article.

1. On the Delivery Controllers page of the Create Store wizard, click Add.
2. In the Add Delivery Controller dialog box, specify a name that will help you to identify the App Controller virtual appliance managing the applications that you want to make available in the store. Ensure that the name does not contain any spaces. Select AppController.

3. Enter the name or IP address of the App Controller virtual appliance in the Server box and specify the port for StoreFront to use for connections to App Controller. The default port is 443.

You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and App Controller deployments. To add applications managed by other App Controller virtual appliances, repeat the procedure above. To make desktops and applications provided by XenDesktop and XenApp available in the store, follow the steps in Add XenDesktop and XenApp resources to the store. When you have added all the required resources to the store, return to Step 7 in the “Create a new deployment” procedure at the top of this article.

**Limitation:** Apps published in AppController might not start. To work around this issue, use the StoreFront PowerShell commands to manually create a store with an authentication service located at <http://sfserver/Citrix/Authentication>.

### **Provide remote access to the store through a NetScaler Gateway appliance**

Complete the following steps to configure remote access through a NetScaler Gateway appliance to the store that you create as part of the initial configuration of your StoreFront server. It is assumed that you have completed Steps 1 to 9 in the “Create a new deployment” procedure at the top of this article.

1. On the Remote Access page of the StoreFront console Create Store UI, click Add.
2. In the Add NetScaler Gateway Appliance dialog box, specify a name for the appliance that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that appliance. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

3. Enter the URL of the virtual server or user logon point (for Access Gateway 5.0) for your appliance. Specify the product version used in your deployment.

For information about creating a single Fully Qualified Domain Name (FQDN) to access a store internally and externally, see [Create a single Fully Qualified Domain Name \(FQDN\) to access a store internally and externally](#).

4. If you are adding an Access Gateway 5.0 appliance, select from the Deployment mode list Appliance. Otherwise, specify the subnet IP address of the NetScaler Gateway appliance, if necessary. A subnet IP address is required for Access Gateway 9.3 appliances, but optional for more recent product versions.

The subnet address is the IP address that NetScaler Gateway uses to represent the user device when communicating with servers on the internal network. This can also be the mapped IP

address of the NetScaler Gateway appliance. Where specified, StoreFront uses the subnet IP address to verify that incoming requests originate from a trusted device.

5. If you are adding an appliance running NetScaler Gateway 10.1, Access Gateway 10, or Access Gateway 9.3, select from the Logon type list the authentication method you configured on the appliance for Citrix Receiver users.

The information you provide about the configuration of your NetScaler Gateway appliance is added to the provisioning file for the store. This enables Citrix Receiver to send the appropriate connection request when contacting the appliance for the first time.

- If users are required to enter their Microsoft Active Directory domain credentials, select Domain.
- If users are required to enter a tokencode obtained from a security token, select Security token.
- If users are required to enter both their domain credentials and a tokencode obtained from a security token, select Domain and security token.
- If users are required to enter a one-time password sent by text message, select SMS authentication.
- If users are required to present a smart card and enter a PIN, select Smart card.

If you configure smart card authentication with a secondary authentication method to which users can fall back if they experience any issues with their smart cards, select the secondary authentication method from the Smart card fallback list.

6. Complete the NetScaler Gateway authentication service URL in the Callback URL box. StoreFront automatically appends the standard portion of the URL. Click Next.

Enter the internally accessible URL of the appliance. StoreFront contacts the NetScaler Gateway authentication service to verify that requests received from NetScaler Gateway originate from that appliance.

7. If you are making resources provided by XenDesktop or XenApp available in the store, list on the Secure Ticket Authority (STA) page URLs for servers running the STA. Add URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence.

The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Secure Ticket Authority (STA) by specifying a key. For information about key generation, see [Manage security keys](#).

In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For infor-

mation about key generation, see [Manage security keys](#).

8. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the Enable session reliability check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the Request tickets from two STAs, where available check box.

When the Request tickets from two STAs, where available check box is selected, StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.

9. Click Create to add your NetScaler Gateway deployment to the list on the Remote Access page.

To add further deployments, repeat the procedure above. To configure remote access to the store through an Access Gateway 5.0 cluster, follow the steps in Provide remote access to the store through an Access Gateway 5.0 cluster. When you have added all your NetScaler Gateway deployments, return to Step 10 in the “Create a new deployment” procedure at the top of this article.

### **Provide remote access to the store through an Access Gateway 5.0 cluster**

Complete the following steps to configure remote access through an Access Gateway 5.0 cluster to the store that you create as part of the initial configuration of your StoreFront server. It is assumed that you have completed Steps 1 to 9 in the “Create a new deployment” procedure at the top of this article.

1. On the Remote Access page of the StoreFront console Create Store UI, click Add.
2. In the Add NetScaler Gateway Appliance dialog box, specify a name for the cluster that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that cluster. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

3. Enter the URL of the user logon point for your cluster and select from the Version list 5.x.
4. From the Deployment mode list, select Access Controller and click Next.
5. On the Appliances page, list the IP addresses or fully qualified domain names (FQDNs) of the appliances in the cluster and click Next.
6. On the Enable Silent Authentication page, list URLs for the authentication service running on the Access Controller servers. Add URLs for multiple servers to enable fault tolerance, listing the servers in order of priority to set the failover sequence. Click Next.

StoreFront uses the authentication service to authenticate remote users so that they do not need to re-enter their credentials when accessing stores.

7. If you are making resources provided by XenDesktop and XenApp available in the store, list on the Secure Ticket Authority (STA) page URLs for servers running the STA. Add URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence.

The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Secure Ticket Authority (STA) by specifying a key. For information about key generation, see [Manage security keys](#).

In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For information about key generation, see [Manage security keys](#).

8. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the Enable session reliability check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the Request tickets from two STAs, where available check box.

When the Request tickets from two STAs, where available check box is selected, StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.

9. Click Create to add your NetScaler Gateway deployment to the list on the Remote Access page.

To add further clusters, repeat the procedure above. To configure remote access to the store through NetScaler Gateway 10.1, Access Gateway 10, Access Gateway 9.3, or a single Access Gateway 5.0 appliance, follow the steps in Provide remote access to the store through a NetScaler Gateway appliance. When you have added all your NetScaler Gateway deployments, return to Step 10 in the “Create a new deployment” procedure at the top of this article.

## Join an existing server group

October 15, 2018

Before installing StoreFront, ensure that the server you are adding to the group is running the same operating system version with the same locale settings as the other servers in the group. StoreFront server groups containing mixtures of operating system versions and locales are not supported. While a server group can contain a maximum of five servers, from a capacity perspective based on simulations, there is no advantage of server groups containing more than three servers. In addition, ensure

that the relative path to StoreFront in IIS on the server you are adding is the same as on the other servers in the group.

**Important**

When you add a new server to a server group, StoreFront service accounts are added as members of the local administrators group on the new server. These services require local administrator permissions to join and synchronize with the server group. If you use Group Policy to prevent addition of new members to the local administrator group or if you restrict the permissions of the local administrator group on your servers, StoreFront cannot join a server group.

1. If the Citrix StoreFront management console is not already open after installation of StoreFront, on the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. In the results pane of the Citrix StoreFront management console, click Join existing server group.
3. Log on to a server in the StoreFront deployment that you wish to join and open the Citrix StoreFront management console. Select the Server Group node in the left pane of the console and, in the Actions pane, click Add Server. Make a note of the authorization code that is displayed.
4. Return to the new server and, in the Join Server Group dialog box, specify the name of the existing server in the Authorizing server box. Enter the authorization code obtained from that server and click Join.

Once joined to the group, the configuration of the new server is updated to match the configuration of the existing server. All the other servers in the group are updated with details of the new server.

To manage a multiple server deployment, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Any configuration changes you make must be propagated to the other servers in the group to ensure a consistent configuration across the deployment.

**Remove a server from an existing server group**

If a StoreFront server was a member of a server group and has been removed, you must run the Clear-DSCConfiguration PowerShell cmdlet to reset the StoreFront server to a factory default state. After you run the Clear-DSCConfiguration cmdlet on the disconnected server, you can add the server back to an existing server group or to a different newly created server group.

1. Open the StoreFront administration console on the primary StoreFront server that you use to manage your entire server group.
2. Select the server group node on the left pane and choose another server to remove.
3. Remove the selected server from the server group.

4. In the Actions pane, propagate changes from the server you used to disconnect one of your server group members. Any other remaining server group members are now aware that a server has been removed from the group. Until you reset the disconnected server to a factory default state, it is not aware that it is no longer a member of the group.
5. Close the administration console on the disconnected server.
6. Open a PowerShell session on your disconnected server after it has been removed from the group and import the StoreFront PowerShell modules using: & “\$Env:PROGRAMFILES\Citrix\Receiver StoreFront\Scripts\ImportModules.ps1”
7. Run the Clear-DSConfiguration command, which resets the server to default settings.
8. Open the StoreFront administration console and the disconnected server is reset and ready to be added to another server group.

## Migrate Web Interface features to StoreFront

January 4, 2019

Many of the Web Interface customizations have equivalents in StoreFront by using JavaScript tweaks, Citrix published APIs, or the StoreFront management console.

The table contains an overview of the customizations and basic information about how to achieve them.

### Folder locations

- For script customizations, append the examples to the script.js file found in

**C:\inetpub\wwwroot\Citrix\StoreNameWeb\custom**

- For style customization, append the example to the style.css file found in

**C:\inetpub\wwwroot\Citrix\StoreNameWeb\custom**

- For dynamic content, add the dynamic context to a text file in

**C:\inetpub\wwwroot\Citrix\StoreNameWeb\customweb**

- If you have a multiserver deployment, you can replicate any changes to other servers from the StoreFront administration console or by using PowerShell.

**Note:** Web Interface enabled individual users to customize various settings. Currently, StoreFront does not have this ability, and while it is possible to add more extensive customization to support it, that is not the focus of this article.

Web Interface Feature	StoreFront Equivalent
<b>Customization with the Management Console</b>	
<ul style="list-style-type: none"><li>• Layout-low graphics</li><li>• Layout-full graphics</li><li>• Allow users to choose</li></ul>	Not applicable. StoreFront auto detects and adjusts the UI to device screen.
<ul style="list-style-type: none"><li>• Enable search</li><li>• Disable search</li></ul>	<ul style="list-style-type: none"><li>• Search is enabled by default.</li><li>• Disable. To hide the search boxes on the desktop/web UI, add the following style to style.css: <b>.search-container { display: none; }</b> To hide the search boxes on the phone UI, add: <b>#searchBtnPhone { display: none; }</b></li></ul>
Enable refresh	Enabled by default (browser refresh).

---

Enable return to last folder

Not enabled by default.

Enable Return to last folder - To remember the current folder, and return to it on load, add the following to script.js

```
CTXS.Extensions.afterDisplayHomeScreen =  
function ()  
{  
  // check if view was saved last time  
  CTXS.ExtensionAPI.localStorage.getItem("view",  
function (view) {  
  if (view) {  
    // if view was saved, change to it  
    CTXS.ExtensionAPI.changeView(view);  
  }  
  if (view == "store") {  
    // if view is store, see if folder was saved  
    CTXS.ExtensionAPI.localStorage.getItem("folder",  
function(folder) {  
  if (folder != "") {  
    // if folder was saved, change to it  
    CTXS.ExtensionAPI.navigateToFolder(folder);  
  }  
  }  
});  
}  
// set up monitoring of folder  
CTXS.Extensions.onFolderChange =  
function(folder) {  
  CTXS.ExtensionAPI.localStorage.setItem("folder",  
folder);  
};  
// set up monitoring of view  
CTXS.Extensions.onViewChange =  
function(newview) {  
  // don't retain search or appinfo views  
  // instead, remember parent view.  
  if ((newview != "appinfo") &&  
(newview != "search")) {  
    CTXS.ExtensionAPI.localStorage.setItem(  
"view", newview);  
  }  
});  
});  
};
```

---

<p>Enable hints</p> <ul style="list-style-type: none"><li>• Icon view</li><li>• Tree view</li><li>• Details view</li><li>• List view</li><li>• Group view</li><li>• Set Default view</li><li>• (Low graphics) Icon view</li><li>• (Low graphics) List view</li><li>• (Low graphics) Default view</li></ul>	<p>Citrix Receiver makes very limited use of tool tips, as it is targeting touch and non-touch devices. You can add tool tips by custom script.</p> <p>Citrix Receiver has a different UI so these choices do not apply. You can use the StoreFront management console to configure views. For more information see, <a href="#">Specify different views for applications and desktops</a>.</p>
<ul style="list-style-type: none"><li>• Single tab UI</li><li>• Tabbed UI<ul style="list-style-type: none"><li>- App tab</li><li>- Desktop tab</li><li>- Content tab</li><li>- (Tab order)</li></ul></li></ul>	<p>The Citrix Receiver UI is tabbed by default, with apps and content in one tab and desktops in the other. There is also an optional <b>Favorite</b> tab.</p>
<ul style="list-style-type: none"><li>• Header logo</li><li>• Text color</li><li>• Header background color</li><li>• Header background image</li></ul>	<p>Equivalents for colors and logos using the StoreFront administration console. Click Customize Website Appearance in the StoreFront administration console's Actions pane and make your customizations on the screen that displays.</p> <p>You can set the header to a background image using a style customization. For example</p> <pre><b>.theme-header-bgcolor { background-image: url('spirals.png'); }</b></pre>

- Pre-logout welcome message (Pre-locale)
  - Title
  - Text
  - Hyperlink
  - Button label

By default, there is no separate pre-logout screen.

This example script adds a click-through message box:

```
var doneClickThrough = false;  
// Before web login  
CTXS.Extensions.beforeLogout = function  
(callback) {  
doneClickThrough = true;  
CTXS.ExtensionAPI.showMessage({  
messageTitle: "Welcome!",  
messageText: "Only for <a  
href="http://www.WWc.com"  
target="_blank">WWCo Employees",  
okButtonText: "Accept",  
okAction: callback  
});  
};  
// Before main screen (for native clients)  
CTXS.Extensions.beforeDisplayHomeScreen  
= function (callback) {  
if (!doneClickThrough) {  
CTXS.ExtensionAPI.showMessage({  
messageTitle: "Welcome!",  
messageText: "Only for WWCo Employees",  
okButtonText: "Accept",  
okAction: callback  
});  
} else {  
callback();  
}  
};
```

- Logon screen title
- Logon screen message
- Logon screen system message

There are four areas for customization on the logon screen(s). Top and bottom of screen (header and footer) and top and bottom of the logon box itself.

```
.customAuthHeader,  
.customAuthFooter  
.customAuthTop,  
.customAuthBottom {  
text-align: center;  
color: white;  
font-size: 16px;  
}
```

Example script (static content)

```
$('#.customAuthHeader').html("Welcome to  
ACME");
```

Example script (dynamic content)

```
function setDynamicContent(txtFile,  
element) {  
CTXS.ExtensionAPI.proxyRequest({  
url: "customweb/"+txtFile,  
success: function(txt)  
{$(element).html(txt);}});  
}
```

```
setDynamicContent("Message.txt",  
".customAuthTop");
```

Note: Do not explicitly include dynamic content in the script, or put it in the **custom** directory, as changes made here force all clients to reload the UI. Put dynamic content in the **customweb** directory.

- Application screen welcome message
- Application screen system message

See the examples for **CustomAuth** welcome screen above.

See examples for dynamic content above. Use **#customTop** rather than **.customAuthTop** to place content on the home screen.

Footer text (all screens)	<p>Example script:</p> <pre><b>#customBottom { text-align: center; color: white; font-size: 16px; }</b></pre> <p>Example static content using a script:</p> <pre><b>\$('#customBottom').html("Welcome to ACME");</b></pre>
<b>Features with no direct equivalent</b>	
<ul style="list-style-type: none"> <li>• Logon screen without headers</li> <li>• Logon screen with headers (including messages)</li> </ul>	There is no direct equivalent in StoreFront. However, you can create custom headers. See “Logon Screen Title” above.
User settings	By default, there are no user settings. You can add menus and buttons from JavaScript.
Workspace control	Equivalent functionality for administrator settings. The extension APIs allow significant additional flexibility. See <a href="http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/receiver-customization-api.html">http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/receiver-customization-api.html</a> .
<b>Deep Customizations (code)</b>	
ICA File generation hooks and other call-routing customizations.	Equivalent or better APIs.  <a href="http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/store-customization-sdk.html">http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/store-customization-sdk.html</a>
Authentication customizations	Equivalent or better APIs. <a href="http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/store-authentication-sdks.html">http://www.citrix.com/go/citrix-developer/storefront-receiver-developer-community/store-authentication-sdks.html</a>
JSP/ASP source access	There are no equivalent APIs on StoreFront, as the UI is not rendered in the same way. There are many JavaScript APIs to enable customization of the UI.

## Configure server groups

September 10, 2019

The tasks below enable you to modify settings for multiple-server StoreFront deployments. To manage a multiple-server deployment, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Any configuration changes you make must be propagated to the other servers in the group to ensure a consistent configuration across the deployment.

You must configure servers comprising a StoreFront server group identically in terms of both StoreFront installation location and IIS website settings, such as physical path and site IDs.

### Add a server to a server group

Use the Add Server task to obtain an authorization code to enable you to join a newly installed StoreFront server to your existing deployment. For more information about adding new servers to existing StoreFront deployments, see [Join an existing server group](#). See the *Scalability* section of [Plan your Storefront deployment](#) to assess how many servers you need in your group.

### Remove servers from a server group

Use the Remove Server task to delete servers from a multiple-server StoreFront deployment. You can remove any server in the group apart from the server on which you are running the task. Before removing a server from a multiple-server deployment, first remove the server from the load-balancing environment.

### Propagate local changes to a server group

Use the Propagate Changes task to update the configuration of all the other servers in a multiple-server StoreFront deployment to match the configuration of the current server. Propagation of configuration information is initiated manually so that you retain control over when and if the servers in the group are updated with configuration changes. While running this task, you cannot make any further changes until all the servers in the group have been updated.

**Important:**

Any changes made on other servers in the group are discarded during propagation. If you update the configuration of a server, propagate the changes to the other servers in the group to avoid losing those changes if you later propagate changes from different server in the deployment.

The information propagated between servers in the group includes the following:

- Contents of all web.config files, which contain the StoreFront configuration.
- Contents of C:\Program Files\Citrix\Receiver StoreFront\Receiver Clients, such as C:\Program Files\Citrix\Receiver StoreFront\Receiver Clients\Windows\CitrixWorkspaceAppWeb.exe and C:\Program Files\Citrix\Receiver StoreFront\Receiver Clients\MAC\CitrixWorkspaceAppWeb.dmg.
- Contents of C:\inetpub\wwwroot\Citrix\StoreWeb\Custom\contrib.
- Contents of C:\inetpub\wwwroot\Citrix\StoreWeb\Custom\custom folder, such as copied images and customisation.js files.
- Contents of the Citrix Delivery Services certificate store.

**Note:**

Subscription data is synchronized with the other servers independently of the Propagate Changes mechanism. It happens automatically without the Propagate Changes task being initiated.

### Change the base URL for a deployment

Use the Change Base URL task to modify the URL that is used as the root of the URLs for the stores and other StoreFront services hosted on a deployment. For multiple-server deployments, specify the load-balanced URL. You can use this task to change from HTTP to HTTPS at any time, provided that Microsoft Internet Information Services (IIS) is configured for HTTPS.

To configure IIS for HTTPS, use the Internet Information Services (IIS) Manager console on the StoreFront server to create a server certificate signed by your Microsoft Active Directory domain certification authority. Then add HTTPS binding to the default website. For more information about creating a server certificate in IIS, see [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637(v=ws.11)). For more information about adding HTTPS binding to an IIS site, see [https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632(v=ws.11)).

### Configure server bypass behavior

To improve performance when some of the servers providing resources become unavailable, StoreFront temporarily bypasses servers that fail to respond. While a server is being bypassed, StoreFront ignores that server and does not use it to access resources. Use these parameters to specify the duration of the bypass behavior:

- **All failed bypass duration** specifies a reduced duration in minutes that StoreFront uses instead of **Bypass duration** if all servers for a particular Delivery Controller are being bypassed. The default is 0 minutes.
- **Bypass duration** specifies the time in minutes that StoreFront bypasses an individual server after a failed attempt to contact that server. The default bypass duration is 60 minutes.

### Considerations when specifying All failed bypass duration

Setting a larger **All failed bypass duration** reduces the impact of unavailability of a particular Delivery Controller; however, it has the negative affect that resources from this Delivery Controller are unavailable to users for the specified duration after a temporary network outage or server unavailability. Consider the use of larger **All failed bypass duration values** when many Delivery Controllers have been configured for a store, particularly for nonbusiness-critical Delivery Controllers.

Setting a smaller **All failed bypass duration** increases the availability of resources served by that Delivery Controller but increases the possibility of client-side timeouts if many Delivery Controllers are configured for a store and several of them become unavailable. It is worth keeping the default 0-minute value when not many farms are configured and for business-critical Delivery Controllers.

### To change the bypass parameters for a store

**Important:** In multiple-server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and click **Manage Delivery Controllers** in the **Actions** pane.
3. Select a controller, click **Edit**, and then click **Settings** on the **Edit Delivery Controller** screen.
4. On the **All failed bypass duration** row, click in the second column and enter a time, in minutes, for which a delivery controller is considered offline after all its servers fail to respond.
5. On the **Bypass duration** row, click in the second column and enter a time, in minutes, for which a single server is considered offline after it fails to respond.

## Configure authentication and delegation

October 15, 2018

Depending on your requirements, there are several authentication and delegations methods.

---

### Configure the authentication service

The authentication service authenticates users to Microsoft Active Directory, ensuring that users do not need to log on again to access their desktops and applications.

#### XML service-based authentication

When StoreFront is not in the same domain as XenApp or XenDesktop, and it is not possible to put Active Directory trusts in place, you can configure StoreFront to use the XenApp and XenDesktop XML Service to authenticate the user name and password credentials.

#### Kerberos constrained delegation for XenApp 6.5

Use the Configure Kerberos Delegation task to specify whether StoreFront uses single-domain Kerberos constrained delegation to authenticate to delivery controllers.

#### Smart card authentication

Set up smart card authentication for all the components in a typical StoreFront deployment.

#### Password expiry notification period

If you enable Citrix Receiver for Web site users to change their passwords at any time, local users whose passwords are about to expire are shown a warning when they log on.

---

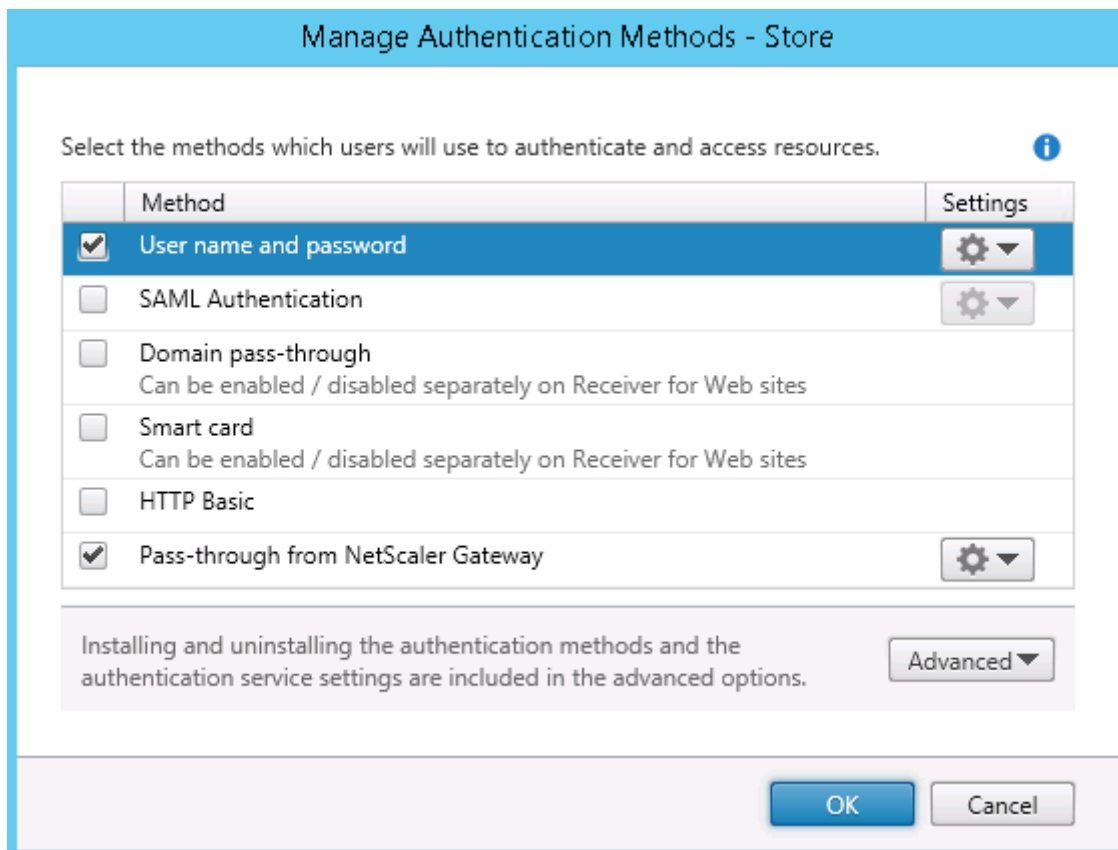

## Configure the authentication service

October 25, 2018

### Manage authentication methods

You can enable or disable user authentication methods set up when the authentication service was created by selecting an authentication method in the results pane of the Citrix StoreFront management console and, in the Actions pane, clicking Manage Authentication Methods.

1. On the Windows Start screen or Apps screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Store** node in the left pane of the Citrix StoreFront management console and, in the **Actions** pane, click **Manage Authentication Methods**.
3. Specify the access methods that you want to enable for your users.

- Select the **Username and password** check box to enable explicit authentication. Users enter their credentials when they access their stores.
- Select the **SAML Authentication** check box to enable integration with a SAML Identity Provider. Users authenticate to an Identity Provider and are automatically logged when they access their stores. From the Settings drop-down menu:
  - Select **Identity Provider** to configure the trust to the Identity Provider.
  - Select **Service Provider** to configure the trust for the Service Provider. This information is required by the Identity Provider.
- Select the Domain pass-through check box to enable pass-through of Active Directory domain credentials from users' devices. Users authenticate to their domain-joined Windows computers and are automatically logged on when they access their stores. In order to use this option, pass-through authentication must be enabled when Citrix Receiver for Windows is installed on users' devices.
- Select the Smart card check box to enable smart card authentication. Users authenticate using smart cards and PINs when they access their stores.
- Select the HTTP Basic check box to enable HTTP Basic authentication. Users authenticate with the StoreFront server's IIS web server.
- Select the Pass-through from NetScaler Gateway check box to enable pass-through authentication from NetScaler Gateway. Users authenticate to NetScaler Gateway and are automatically

logged on when they access their stores.

To enable pass-through authentication for smart card users accessing stores through NetScaler Gateway, use the Configure Delegated Authentication task.

### **Configure trusted user domains**

Use the Trusted Domains task to restrict access to stores for users logging on with explicit domain credentials, either directly or using pass-through authentication from NetScaler Gateway.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the results pane, select the appropriate authentication method. In the Actions pane, click **Manage Authentication Methods**.
3. From the **User name and password (explicit) > Settings** drop-down menu, select **Configure Trusted Domains**.
4. Select **Trusted Domains only** and click Add to enter the name of a trusted domain. Users with accounts in that domain will be able to log on to all stores that use the authentication service. To modify a domain name, select the entry in the Trusted domains list and click Edit. Select a domain in the list and click Remove to discontinue access to stores for user accounts in that domain.

The way in which you specify the domain name determines the format in which users must enter their credentials. If you want users to enter their credentials in domain user name format, add the NetBIOS name to the list. To require that users enter their credentials in user principal name format, add the fully qualified domain name to the list. If you want to enable users to enter their credentials in both domain user name format and user principal name format, you must add both the NetBIOS name and the fully qualified domain name to the list.

5. If you configure multiple trusted domains, select from the Default domain list the domain that is selected by default when users log on.
6. If you want to list the trusted domains on the logon page, select the Show domains list in logon page check box.

### **Enable users to change their passwords**

Use the **Manage Password Options** task to enable desktop Receivers and Receiver for Web site users logging on with domain credentials to change their passwords. When you create the authentication service, the default configuration prevents Citrix Receiver and Citrix Receiver for Web site users from changing their passwords, even if the passwords have expired. If you decide to enable this feature, ensure that the policies for the domains containing your servers do not prevent users from changing

their passwords. Enabling users to change their passwords exposes sensitive security functions to anyone who can access any of the stores that use the authentication service. If your organization has a security policy that reserves user password change functions for internal use only, ensure that none of the stores are accessible from outside your corporate network.

1. Citrix Receiver for Web supports password changes on expiration, as well as elective password changes. All desktop Citrix Receivers support password change through NetScaler Gateway on expiration only. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and in the Actions pane, click Manage Authentication Methods.
3. From the **User name and passwords > Settings** drop-down menu select **Manage Password Options**, specify the circumstances under which Citrix Receiver for Web site users logging on with domain credentials are able to change their passwords.
  - To enable users to change their passwords whenever they want, select At any time. Local users whose passwords are about to expire are shown a warning when they log on. Password expiry warnings are only displayed to users connecting from the internal network. By default, the notification period for a user is determined by the applicable Windows policy setting. For more information about setting custom notification periods, see [Configure the password expiry notification period](#). Supported only with Citrix Receiver for Web.
  - To enable users to change their passwords only when the passwords have already expired, select When expired. Users who cannot log on because their passwords have expired are redirected to the Change Password dialog box. Supported for desktop Citrix Receivers and Citrix Receiver for Web.
  - To prevent users from changing their passwords, do not select **Allow users to change passwords**. If you do not select this option, you must make your own arrangements to support users who cannot access their desktops and applications because their passwords have expired.

If you enable Citrix Receiver for Web site users to change their passwords at any time, ensure that there is sufficient disk space on your StoreFront servers to store profiles for all your users. To check whether a user's password is about to expire, StoreFront creates a local profile for that user on the server. StoreFront must be able to contact the domain controller to change users' passwords.

	User can change an expired password if enabled on StoreFront	User is notified that password will expire	User can change password before it expires if enabled on StoreFront
Citrix Receivers			
Windows	Yes		
Mac	Yes		
Android			
iOS			
Linux	Yes		
Web	Yes	Yes	Yes

### Self-Service Password Reset security questions

Self-Service Password Reset enables end users to have greater control over their user accounts. Once you configure Self-Service Password Reset, if end users have problems logging on to their systems, they can unlock their accounts or reset their passwords to something new by correctly answering several security questions.

When setting up Self-Service Password Reset, you specify which users are able to perform password resets and unlock their accounts using the management console. If you enable these features for the StoreFront, users might still be denied permission to perform these tasks based on the settings configured in the Self-Service Password Reset configuration console.

Self-Service Password Reset is available only to users accessing StoreFront using HTTPS connections. They cannot access StoreFront using an HTTP connection and have Self-Service Password Reset available. Self-Service Password Reset is available only when authenticating directly to StoreFront with a user name and password.

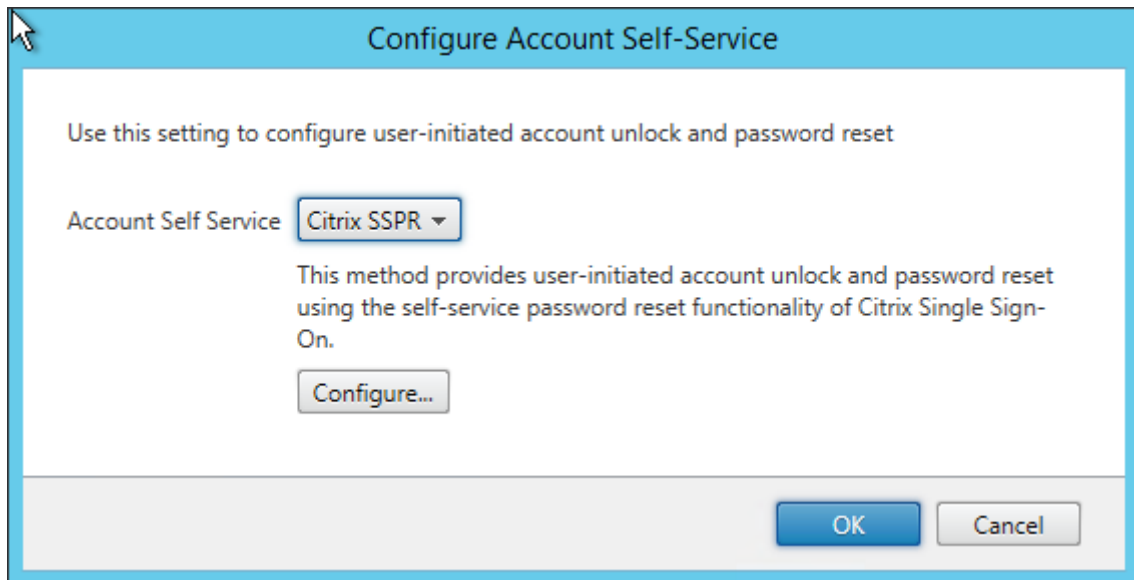

Self-Service Password Reset does not support UPN logons, such as username@domain.com.

Before configuring Self-Service Password Reset for a store, you must ensure that:

- The store is configured to use user name and password authentication.
- The store is configured to use only one Self-Service Password Reset. If StoreFront is configured to use multiple farms within the same or trusted domains, you must configure Self-Service Password Reset to accept credentials from all of those domains.
- The store is configured to allow users to change their password at any time if you want to enable password reset functionality.
- You must associate a StoreFront store with a Receiver for Web site, and you must configure that site to use the unified experience.

Before being able to use Self-Service Password Reset, you must install and configure it. It is available on the XenApp and XenDesktop media. For information, see the [Self-Service Password Reset](#) documentation.

1. Enable Self-Service Password Reset support in StoreFront by selecting the **Stores** node in the left pane of the Citrix StoreFront management console and in the **Actions** pane, click **Manage Authentication Methods > User name and Password**, and choose **Manage Password Options** from the drop-down menu.
2. Choose when you want users to change passwords and click **OK**.
3. From the **User name and passwords** drop-down menu, choose **Configure Account Self-Service**, select **Citrix SSPR** from the drop-down menu, and click **OK**.
4. Specify whether or not users can reset their passwords and unlock their accounts with Self-Service Password Reset, add the Password Reset Service account URL, click **OK**, and then click **OK**.

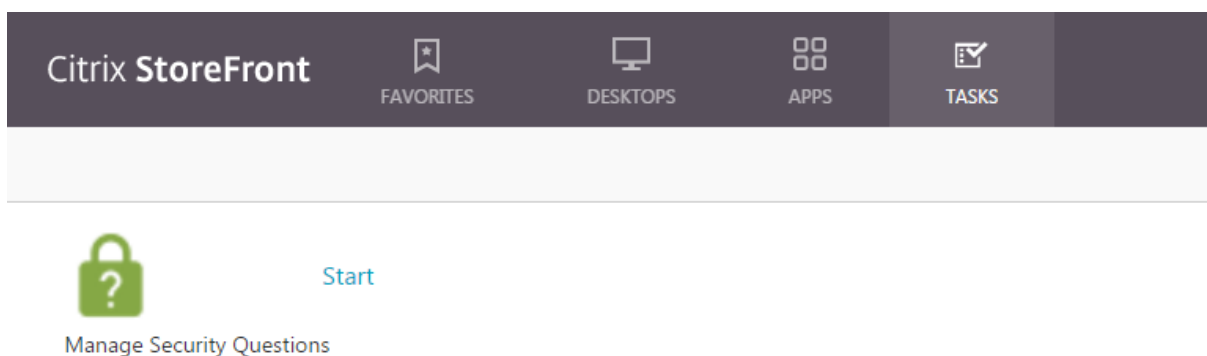

This option is available only when the StoreFront base URL is HTTPS (not HTTP) and the **Enable password reset** option is available only after you use **Manage Password Options** to allow users to change passwords at any time.

The image shows a dialog box titled "Configure Citrix SSPR". The main text reads: "Specify whether or not users can reset their passwords and unlock their accounts through integration with Citrix SSPR." There are two checked checkboxes: "Enable password reset" and "Allow account unlock". Below these is a text input field for "SSPR Account Service URL" containing the value "https://server.fullyqualifieddomain/MPMService". At the bottom right are "OK" and "Cancel" buttons.

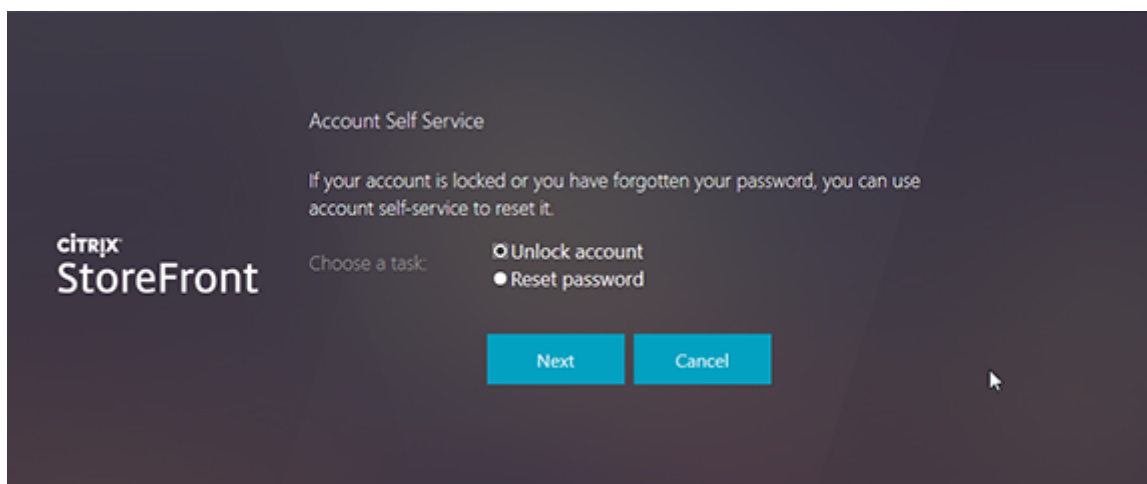

The next time the user logs on to Citrix Receiver or Citrix Receiver for Web, security enrollment is available. After clicking **Start**, questions are displayed to which the user must specify answers.

Once configured in StoreFront, users see the **Account Self-Service** link on the Citrix Receiver for Web logon screen (it displays as a button in other Citrix Receivers).

Clicking this link takes the user through a series of forms to first select between **Unlock account** and **Reset password** (if both are available).

After choosing a radio button and clicking **Next**, the next screen prompts for a domain and username (*domain\user*) if that information was not entered in the log on form. Note that account self-service does not support UPN log ons, such as *username@domain.com*

They are required to answer the security question. If all the answers match those supplied by the user, the requested operation (unlock or reset) is performed and the user is notified that it succeeded.

## Shared authentication service settings

Use the Shared Authentication Service Settings task to specify stores that will share the authentication service enabling single sign on between them.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Manage Authentication Methods**.
3. From the **Advanced** drop-down menu, select **Shared authentication service settings**.
4. Click the **Use shared authentication service** check box and select a store from the **Store** name drop-down menu.

**Note:** There is no functional difference between a shared and dedicated authentication service. An authentication service shared by more than two stores is treated as a shared authentication service and any configuration changes affect the access to all the stores using the shared authentication service.

## Delegate credential validation to NetScaler Gateway

Use the Configure Delegated Authentication task to enable pass-through authentication for smart card users accessing stores through NetScaler Gateway. This task is only available when Pass-through from NetScaler Gateway is enabled and selected in the results pane.

When credential validation is delegated to NetScaler Gateway, users authenticate to NetScaler Gateway with their smart cards and are automatically logged on when they access their stores. This setting is disabled by default when you enable pass-through authentication from NetScaler Gateway, so that pass-through authentication only occurs when users log on to NetScaler Gateway with a password.

## XML service-based authentication

October 15, 2018

When StoreFront is not in the same domain as XenApp or XenDesktop, and it is not possible to put Active Directory trusts in place, you can configure StoreFront to use the XenApp and XenDesktop XML Service to authenticate the user name and password credentials.

### Enable XML service-based authentication

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click **Manage Authentication Methods**.
3. On the **Manage Authentication Methods** page, from the **User name and password > Settings** drop-down menu, select **Configure Password Validation**.
4. From the **Validation Password Via** drop-down menu, select **Delivery Controllers**, and then click **Configure**.
5. Follow the **Configure Delivery Controllers** screens to add one or more **Delivery Controllers** for validating the user credentials and click **OK**.

### Disable XML service-based authentication

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click **Manage Authentication Methods**.
3. On the **Manage Authentication Methods** page, from the **User name and password > Settings** drop-down menu, select **Configure Password Validation**.
4. From the **Validation Password Via** drop-down menu, select **Active Directory**, and then click **OK**.

## Configure Kerberos constrained delegation for XenApp 6.5

October 15, 2018

Use the **Configure Store Settings > Kerberos delegation** task to specify whether StoreFront uses single-domain Kerberos constrained delegation to authenticate to delivery controllers.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running

on any of the other servers in the deployment. Once complete, propagate your configuration changes to the server group so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the Actions pane, click **Configure Store Settings**, and then click Kerberos Delegation.
3. Select Enable or Disable Kerberos delegation to authenticate to delivery controllers, respectively, enable or disable Kerberos constrained delegation.

### **Configure the StoreFront server for delegation**

Follow this procedure when StoreFront is not installed on the same machine as XenApp.

1. On the domain controller, open the MMC Active Directory Users and Computers snap-in.
2. On the View menu, click Advanced Features.
3. In the left pane, click the Computers node under the domain name and select the StoreFront server.
4. In the Action pane, click Properties.
5. On the Delegation tab, click Trust this computer for delegation to specified services only and Use any authentication protocol, and then click Add.
6. In the Add Services dialog box, click Users or Computers.
7. In the Select Users or Computers dialog box, type the name of the server running the Citrix XML Service (XenApp) in the Enter the object names to select box, click OK.
8. Select the HTTP service type from the list, click OK.
9. Apply the changes and close the dialog box.

### **Configure XenApp server for delegation**

Configure Active Directory Trusted Delegation for each XenApp server.

1. On the domain controller, open the **MMC Active Directory Users and Computers** snap-in.
2. In the left pane, click the **Computers** node under the domain name and select the server running the Citrix XML Service (XenApp) that StoreFront is configured to contact.
3. In the **Action** pane, click **Properties**.
4. On the **Delegation** tab, click **Trust this computer for delegation to specified services only** and **Use any authentication protocol**, and then click **Add**.
5. In the **Add Services** dialog box, click **Users or Computers**.
6. In the **Select Users or Computers** dialog box, type the name of the server running the Citrix XML Service (XenApp) in the **Enter the object names to select** box, click **OK**.
7. Select the HOST service type from the list, click **OK**, and then click **Add**.

8. In the **Select Users or Computers** dialog box, type the name of the Domain Controller in the **Enter the object names to select box** and click **OK**.
9. Select the **cifs** and **ldap** service types from the list and click **OK**. Note: If two choices appear for the **ldapservice**, select the one that matches the FQDN of the domain controller.
10. Apply the changes and close the dialog box.

### Important considerations

When you decide whether to use Kerberos constrained delegation, consider the following information.

- Key Notes:
  - You do not need `ssonsvr.exe` unless doing pass-through authentication (or smart card pin pass-through authentication) without Kerberos constrained delegation.
- Storefront and Citrix Receiver for Web domain pass-through:
  - You do not need `ssonsvr.exe` on the client.
  - You can set the Local username and password in the Citrix `icaclient.adm` template to anything (controls `ssonsvr.exe` function).
  - The `icaclient.adm` template Kerberos setting is required.
  - Add the Storefront Fully Qualified Domain Name (FQDN) to Internet Explorer trusted sites list. Check the Use local username box in the Internet Explorer security settings for the trusted zone.
  - The client must be in a domain.
  - Enable the Domain pass-through authentication method on the StoreFront server and enable for Citrix Receiver for Web.
- Storefront, Citrix Receiver for Web, and smart card authentication with PIN prompt:
  - You do not need `ssonsvr.exe` on the client.
  - Smart card authentication was configured.
  - You can set the Local username and password in the Citrix `icaclient.adm` template to anything (controls `ssonsvr.exe` function).
  - The `icaclient.adm` template Kerberos setting is required.
  - Enable the Smart card authentication method on the StoreFront server and enable for Citrix Receiver for Web.
  - To ensure smart card authentication is chosen, do not check the Use local username box in the Internet Explorer security settings for the StoreFront site zone.
  - The client must be in a domain.
- NetScaler Gateway, StoreFront, Citrix Receiver for Web, and smart card authentication with PIN prompt:
  - You do not need `ssonsvr.exe` on the client.
  - Smart card authentication was configured.
  - You can set the Local username and password in the Citrix `icaclient.adm` template to anything (controls `ssonsvr.exe` function).
  - The `icaclient.adm` template Kerberos setting is required.

- Enable the Pass-through from NetScaler Gateway authentication method on the StoreFront server and enable for Citrix Receiver for Web.
- To ensure smart card authentication is chosen, do not check the Use local username box in the Internet Explorer security settings for the StoreFront site zone.
- The client must be in a domain.
- Configure NetScaler Gateway for smart card authentication and configure an additional vServer for launch using StoreFront HDX routing to route the ICA traffic through the unauthenticated NetScaler Gateway vServer.
- Citrix Receiver for Windows (AuthManager), smart card authentication with PIN prompt, and StoreFront:
  - You do not need ssonsvr.exe on the client.
  - You can set the Local username and password in the Citrix icaclient.adm template to anything (controls ssonsvr.exe function).
  - The icaclient.adm template Kerberos setting is required.
  - The client must be in a domain.
  - Enable the Smart card authentication method on the StoreFront server.
- Citrix Receiver for Windows (AuthManager), Kerberos, and StoreFront:
  - You do not need ssonsvr.exe on the client.
  - You can set the Local username and password in the Citrix icaclient.adm template to anything (controls ssonsvr.exe function).
  - The icaclient.adm template Kerberos setting is required.
  - Check the Use local username box in the Internet Explorer security settings for the trusted zone.
  - The client must be in a domain.
  - Enable the Domain pass-through authentication method on the StoreFront server.
  - Ensure this registry key is set:

**Caution:** Editing the registry incorrectly can cause serious problems that may require you to reinstall your operating system. Citrix cannot guarantee that problems resulting from the incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Be sure to back up the registry before you edit it.

For 32-bit machines: HKEY\_LOCAL\_MACHINE\SOFTWARE\Citrix\AuthManagerProtocols\integratedwindows  
Name: SSONCheckEnabled  
Type: REG\_SZ  
Value: true or false

For 64-bit machines: HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\Citrix\AuthManagerProtocols\integratedwindows  
Name: SSONCheckEnabled  
Type: REG\_SZ  
Value: true or false

## Configure smart card authentication

February 25, 2021

This article gives an overview of the tasks involved in setting up smart card authentication for all the components in a typical StoreFront deployment. For more information and step-by-step configuration instructions, see the documentation for the individual products.

[Smart card configuration for Citrix environments \(PDF\)](#)

This overview for configuring a Citrix deployment for smart cards uses a specific smart card type. Note that similar steps apply to smart cards from other vendors.

### Prerequisites

- Ensure that accounts for all users are configured either within the Microsoft Active Directory domain in which you plan to deploy your StoreFront servers or within a domain that has a direct two-way trust relationship with the StoreFront server domain.
- If you plan to enable pass-through with smart card authentication, ensure that your smart card reader types, middleware type and configuration, and middleware PIN caching policy permit this.
- Install your vendor's smart card middleware on the virtual or physical machines running the Virtual Delivery Agent that provide users' desktops and applications. For more information about using smart cards with XenDesktop, see [Smart cards](#).
- Before continuing, ensure that your public-key infrastructure is configured appropriately. Check that certificate to account mapping is configured correctly for your Active Directory environment and that user certificate validation can be performed successfully.

### Configure NetScaler Gateway

- On your NetScaler Gateway appliance, install a signed server certificate from a certification authority. For more information, see [Installing and Managing Certificates](#).
- Install on your appliance the root certificate of the certification authority issuing your smart card user certificates. For more information, see [To install a root certificate on NetScaler Gateway](#).
- Create and configure a virtual server for client certificate authentication. Create a certificate authentication policy, specifying SubjectAltName:PrincipalName for user name extraction from the certificate. Then, bind the policy to the virtual server and configure the virtual server to request client certificates. For more information, see [Configuring and Binding a Client Certificate Authentication Policy](#).

- Bind the certification authority root certificate to the virtual server. For more information, see [To add a root certificate to a virtual server](#).
- To ensure that users do not receive an additional prompt for their credentials at the virtual server when connections to their resources are established, create a second virtual server. When you create the virtual server, disable client authentication in the Secure Sockets Layer (SSL) parameters. For more information, see [Configuring smart card authentication](#).

You must also configure StoreFront to route user connections to resources through this additional virtual server. Users log on to the first virtual server and the second virtual server is used for connections to their resources. When the connection is established, users do not need to authenticate to NetScaler Gateway but are required to enter their PINs to log on to their desktops and applications. Configuring a second virtual server for user connections to resources is optional unless you plan to enable users to fall back to explicit authentication if they experience any issues with their smart cards.

- Create session policies and profiles for connections from NetScaler Gateway to StoreFront and bind them to the appropriate virtual server. For more information, see [Access to StoreFront Through NetScaler Gateway](#).
- If you configured the virtual server used for connections to StoreFront to require client certificate authentication for all communications, you must create a further virtual server to provide the callback URL for StoreFront. This virtual server is used only by StoreFront to verify requests from the NetScaler Gateway appliance and so does not need to be publically accessible. A separate virtual server is required when client certificate authentication is mandatory because StoreFront cannot present a certificate to authenticate. For more information, see [Creating Virtual Servers](#).

## Configure StoreFront

- You must use HTTPS for communications between StoreFront and users' devices to enable smart card authentication. Configure Microsoft Internet Information Services (IIS) for HTTPS by obtaining an SSL certificate in IIS and then adding HTTPS binding to the default website. For more information about creating a server certificate in IIS, see [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2012-R2-and-2012/hh831637(v=ws.11)). For more information about adding HTTPS binding to an IIS site, see [https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/orphan-topics/ws.11/hh831632(v=ws.11)).
- If you want to require that client certificates are presented for HTTPS connections to all StoreFront URLs, configure IIS on the StoreFront server.

When StoreFront is installed, the default configuration in IIS only requires that client certificates are presented for HTTPS connections to the certificate authentication URL of the StoreFront au-

thentication service. This configuration is required to provide smart card users with the option to fall back to explicit authentication and, subject to the appropriate Windows policy settings, enable users to remove their smart cards without needing to reauthenticate.

When IIS is configured to require client certificates for HTTPS connections to all StoreFront URLs, smart card users cannot connect through NetScaler Gateway and cannot fall back to explicit authentication. Users must log on again if they remove their smart cards from their devices. To enable this IIS site configuration, the authentication service and stores must be collocated on the same server, and a client certificate that is valid for all the stores must be used. Moreover, this configuration where IIS is requiring client certificates for HTTPS connections to all StoreFront URLs, will conflict with authentication for Citrix Receiver for Web clients. For this reason, this configuration should be used when Citrix Receiver for Web client access is not required.

If you are installing StoreFront on Windows Server 2012, note that non-self-signed certificates installed in the Trusted Root Certification Authorities certificate store on the server are not trusted when IIS is configured to use SSL and client certificate authentication. For more information about this issue, see <http://support.microsoft.com/kb/2802568>.

- Install and configure StoreFront. Create the authentication service and add your stores, as required. If you configure remote access through NetScaler Gateway, do not enable virtual private network (VPN) integration. For more information, see [Install and set up StoreFront](#).
- Enable smart card authentication to StoreFront for local users on the internal network. For smart card users accessing stores through NetScaler Gateway, enable the pass-through with NetScaler Gateway authentication method and ensure that StoreFront is configured to delegate credential validation to NetScaler Gateway. If you plan to enable pass-through authentication when you install Citrix Receiver for Windows on domain-joined user devices, enable domain pass-through authentication. For more information, see [Configure the authentication service](#).

To allow Citrix Receiver for Web client authentication with smart cards, you must enable the authentication method per Citrix Receiver for Web site. For more information, see the [Configure Citrix Receiver for Web sites](#) instruction.

If you want smart card users to be able to fall back to explicit authentication if they experience any issues with their smart cards, do not disable the user name and password authentication method.

- If you plan to enable pass-through authentication when you install Citrix Receiver for Windows on domain-joined user devices, edit the default.ica file for the store to enable pass-through of users' smart card credentials when they access their desktops and applications. For more information, see [Enable pass-through with smart card authentication for Citrix Receiver for Windows](#).
- If you created an additional NetScaler Gateway virtual server to be used only for user connections to resources, configure optimal NetScaler Gateway routing through this virtual server for

connections to the deployments providing the desktops and applications for the store. For more information, see [Configure optimal HDX routing for a store](#).

- To enable users of non-domain-joined Windows desktop appliances to log on to their desktops using smart cards, enable smart card authentication to your Desktop Appliance sites. For more information, see [Configure Desktop Appliance sites](#).

Configure the Desktop Appliance site for both smart card and explicit authentication to enable users to log on with explicit credentials if they experience any issues with their smart cards.

- To enable users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock to authenticate using smart cards, enable pass-through with smart card authentication to your XenApp Services URLs. For more information, see [Configure authentication for XenApp Services URLs](#).

### **Configure user devices**

- Ensure that your vendor's smart card middleware is installed on all user devices.
- For users with non-domain-joined Windows desktop appliances, install Receiver for Windows Enterprise using an account with administrator permissions. Configure Internet Explorer to start in full-screen mode displaying the Desktop Appliance site when the device is powered on. Note that Desktop Appliance site URLs are case sensitive. Add the Desktop Appliance site to the Local intranet or Trusted sites zone in Internet Explorer. Once you have confirmed that you can log on to the Desktop Appliance site with a smart card and access resources from the store, install the Citrix Desktop Lock. For more information, see [To install the Desktop Lock](#).
- For users with domain-joined desktop appliances and repurposed PCs, install Receiver for Windows Enterprise using an account with administrator permissions. Configure Receiver for Windows with the XenApp Services URL for the appropriate store. Once you have confirmed that you can log on to the device with a smart card and access resources from the store, install the Citrix Desktop Lock. For more information, see [To install the Desktop Lock](#).
- For all other users, install the appropriate version of Citrix Receiver on the user device. To enable pass-through of smart card credentials to XenDesktop and XenApp for users with domain-joined devices, use an account with administrator permissions to install Receiver for Windows at a command prompt with the /includeSSON option. For more information, see [Configure and install Receiver for Windows using command-line parameters](#).

Ensure that Receiver for Windows is configured for smart card authentication either through a domain policy or a local computer policy. For a domain policy, use the Group Policy Management Console to import the Receiver for Windows Group Policy Object template file, ica-client.adm, onto the domain controller for the domain containing your users' accounts. To configure an individual device, use the Group Policy Object Editor on that device to configure the

template. For more information, see [Configure Receiver with the Group Policy Object template](#).

Enable the Smart card authentication policy. To enable pass-through of users' smart card credentials, select Use pass-through authentication for PIN. Then, to pass users' smart card credentials through to XenDesktop and XenApp, enable the Local user name and password policy and select Allow pass-through authentication for all ICA connections. For more information, see [ICA Settings Reference](#).

If you enabled pass-through of smart card credentials to XenDesktop and XenApp for users with domain-joined devices, add the store URL to the Local intranet or Trusted sites zone in Internet Explorer. Ensure that Automatic logon with the current user name and password is selected in the security settings for the zone.

- Where necessary, provide users with connection details for the store (for users on the internal network) or NetScaler Gateway appliance (for remote users) using an appropriate method. For more information about providing configuration information to your users, see [Citrix Receiver](#).

### **Enable pass-through with smart card authentication for Receiver for Windows**

You can enable pass-through authentication when you install Receiver for Windows on domain-joined user devices. To enable pass-through of users' smart card credentials when they access desktops and applications hosted by XenDesktop and XenApp, you edit the default.ica file for the store.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the default.ica file for the store, which is typically located in the C:\inetpub\wwwroot\Citrix\storename\App\_Data\ directory, where storename is the name specified for the store when it was created.
2. To enable pass-through of smart card credentials for users who access stores without NetScaler Gateway, add the following setting in the [Application] section.

```
1 DisableCtrlAltDel=Off
2 <!--NeedCopy-->
```

This setting applies to all users of the store. To enable both domain pass-through and pass-through with smart card authentication to desktops and applications, you must create separate stores for each authentication method. Then, direct your users to the appropriate store for their method of authentication.

3. To enable pass-through of smart card credentials for users accessing stores through NetScaler Gateway, add the following setting in the [Application] section.

```
1 UseLocalUserAndPassword=On
2 <!--NeedCopy-->
```

This setting applies to all users of the store. To enable pass-through authentication for some users and require others to log on to access their desktops and applications, you must create separate stores for each group of users. Then, direct your users to the appropriate store for their method of authentication.

## Configure the password expiry notification period

October 15, 2018

If you enable Citrix Receiver for Web site users to change their passwords at any time, local users whose passwords are about to expire are shown a warning when they log on. By default, the notification period for a user is determined by the applicable Windows policy setting. To set a custom notification period for all users, you edit the configuration file for the authentication service.

**Important:** In multiple-server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click **Manage Authentication Methods**.
3. On the **Manage Authentication Methods** page, from the **User name and password > Settings** drop-down menu, select **Manage Password Options**, and select the **Allow users to change passwords** check box.
4. Select **At any time... \*\*and make a choice under** Remind users before their passwords expire\*\*.

**Note:** StoreFront does not support Fine Grained Password Policies in Active Directory.

## Configure and manage stores

November 5, 2018

In Citrix StoreFront, you can create and manage stores that aggregate applications and desktops from XenApp and XenDesktop giving users on-demand, self-service access to resources.

---

<a href="#">Create or remove a store</a>	Configure as many additional stores as you need.
<a href="#">Create an unauthenticated store</a>	Configure additional unauthenticated stores to support access for unauthenticated (anonymous) users.
<a href="#">Export store provisioning files for users</a>	Generate files containing connection details for stores, including any NetScaler Gateway deployments and beacons configured for the stores.
<a href="#">Hide and advertise stores to users</a>	Prevent stores being presented to users to add to their accounts when they configure Citrix Receiver through email-based account discovery or FQDN.
<a href="#">Manage the resources made available in stores</a>	Add and remove resources from stores.
<a href="#">Manage remote access to stores through NetScaler Gateway</a>	Configure access to stores through NetScaler Gateway for users connecting from public networks.
<a href="#">Integrate Citrix Online applications with stores</a>	Select the Citrix Online applications to include in a store and specify the action that Citrix Receiver takes when users subscribe to a Citrix Online application.
<a href="#">Configure two StoreFront stores to share a common subscription datastore</a>	Configure two stores to share a common subscription database.
<a href="#">Advanced store settings</a>	Configure advanced store settings.

---

## Create or remove a store

February 15, 2021

Use the Create Store task to configure additional stores. You can create as many stores as you need; for example, you can create a store for a particular group of users or to group together a specific set

of resources. You can also create an unauthenticated store that allows for anonymous, or unauthenticated store. To create this type of store, refer to the [Create an unauthenticated store](#) instruction.

To create a store, you identify and configure communications with the servers providing the resources that you want to make available in the store. Then, optionally, you configure remote access to the store through NetScaler Gateway.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

### **Add desktops and applications to the store**

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click Create Store.
3. On the Store Name page, specify a name for your store and click Next.  
  
Store names appear in Citrix Receiver under users' accounts, so choose a name that gives users information about the content of the store.
4. On the Delivery Controllers page, list the infrastructure providing the resources that you want to make available in the store. Click Add.
5. In the Add Delivery Controller dialog box, specify a name that will help you to identify the deployment and indicate whether the resources that you want to make available in the store are provided by XenDesktop, XenApp, or AppController. For App Controller deployments, ensure that the name you specify does not contain any spaces.
6. If you are adding details of XenDesktop or XenApp servers, continue to Step 7. To make applications managed by App Controller available in the store, enter the name or IP address of an App Controller virtual appliance in the Server box and specify the port for StoreFront to use for connections to App Controller. The default port is 443. Continue to Step 11.
7. To make desktops and applications provided by XenDesktop or XenApp available in the store, add the names or IP addresses of your servers to the Servers list. Specify multiple servers to enable fault tolerance, listing the entries in order of priority to set the failover sequence. For XenDesktop sites, give details of Delivery Controllers. In the case of XenApp farms, list servers running the Citrix XML Service.
8. Select from the Transport type list the type of connections for StoreFront to use for communications with the servers.

- To send data over unencrypted connections, select HTTP. If you select this option, you must make your own arrangements to secure connections between StoreFront and your servers.
- To send data over secure HTTP connections using Secure Sockets Layer (SSL) or Transport Layer Security (TLS), select HTTPS. If you select this option for XenDesktop and XenApp servers, ensure that the Citrix XML Service is set to share its port with Microsoft Internet Information Services (IIS) and that IIS is configured to support HTTPS.
- To send data over secure connections to XenApp servers using the SSL Relay to perform host authentication and data encryption, select SSL Relay.

Note: If you are using HTTPS or the SSL Relay to secure connections between StoreFront and your servers, ensure that the names you specify in the Servers list match exactly (including the case) the names on the certificates for those servers.

9. Specify the port for StoreFront to use for connections to the servers. The default port is 80 for connections using HTTP and the SSL Relay, and 443 for HTTPS connections. In the case of XenDesktop and XenApp servers, the specified port must be the port used by the Citrix XML Service.  
  
In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Delivery Controllers by specifying a key. For information about key generation and configuration, see [Manage security keys](#).  
  
In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For information about key generation and configuration, see [Manage security keys](#).
10. If you are using the SSL Relay to secure connections between StoreFront and XenApp servers, specify the TCP port of the SSL Relay in the SSL Relay port box. The default port is 443. Ensure that all the servers running the SSL Relay are configured to monitor the same port.
11. Click OK. You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and App Controller deployments. Repeat Steps 4 to 11, as necessary, to list additional deployments providing resources for the store. When you have added all the required resources to the store, click Next.
12. On the Remote Access page, specify whether and how users connecting from public networks can access the store through NetScaler Gateway.
  - To make the store unavailable to users on public networks, make sure you do not check **Enable Remote Access**. Only local users on the internal network will be able to access the store.
  - To enable remote access, check **Enable Remote Access**.
    - To make only resources delivered through the store available through NetScaler Gateway, select No VPN tunnel. Users log on directly to NetScaler Gateway and do not need to use the NetScaler Gateway Plug-in.

- To make the store and all other resources on the internal network available through an SSL virtual private network (VPN) tunnel, select Full VPN tunnel. Users require the NetScaler Gateway Plug-in to establish the VPN tunnel.

If it is not already enabled, the pass-through from NetScaler Gateway authentication method is automatically enabled when you configure remote access to the store. Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores.

13. If you enabled remote access, continue to the next procedure to specify the NetScaler Gateway deployments through which users can access the store. Otherwise, on the Remote Access page, click Create. Once the store has been created, click Finish.

### **Provide remote access to the store through NetScaler Gateway**

Complete the following steps to configure remote access through NetScaler Gateway to the store that you created in the previous procedure. It is assumed that you have completed all the preceding steps.

1. On the **Remote Access** page of the **Create Store** wizard, select from the **NetScaler Gateway appliances** list the deployments through which users can access the store. Any deployments you configured previously for other stores are available for selection in the list. If you want to add a further deployment to the list, click Add. Otherwise, continue to Step 12.
2. On the **Add NetScaler Gateway Appliance General Settings** page, specify a name for the NetScaler Gateway deployment that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that deployment. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

3. Enter the URL of the virtual server or user logon point for your deployment. Specify the product version used in your deployment.

The fully qualified domain name (FQDN) for your StoreFront deployment must be unique and different from the NetScaler Gateway virtual server FQDN. Using the same FQDN for StoreFront and the NetScaler Gateway virtual server is not supported.

4. Select the usage of the NetScaler Gateway from the available options.
  - + **Authentication and HDX routing:** The NetScaler Gateway will be used for Authentication, as well as for routing any HDX sessions.
  - + **Authentication Only:** The NetScaler Gateway will be used for Authentication and not for any HDX session routings.
  - + **HDX routing Only:** The NetScaler Gateway will be used for HDX session routings and not for Authentication.

5. On the Secure Ticket Authority (STA) page, if you are making resources provided by XenDesktop or XenApp available in the store, list all the Secure Ticket Authority page URLs for servers running the STA. Add URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence.

The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Secure Ticket Authority (STA) by specifying a key. For information about key generation, see [Manage security keys](#).

In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For information about key generation, see [Manage security keys](#).

6. Choose to set the Secure Ticket Authority to be load balanced. You can also specify the time interval after which the non-responding STAs are bypassed.
7. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the **Enable session reliability** check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the **Request tickets from two STAs**, where available check box. StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.
8. On Authentication Settings page, select the version of NetScaler gateway you want to configure.
9. Specify the VServer IP address of the NetScaler Gateway appliance, if required. A VServer IP address is required for Access Gateway 9.x appliances, but optional for more recent product versions. The VServer IP address is the IP address that NetScaler Gateway uses to represent the user device when communicating with servers on the internal network. This can also be the mapped IP address of the NetScaler Gateway appliance. Where specified, StoreFront uses the VServer IP address to verify that incoming requests originate from a trusted device.
10. Select from the Logon type list the authentication method you configured on the appliance for Citrix Receiver users. The information you provide about the configuration of your NetScaler Gateway appliance is added to the provisioning file for the store. This enables Citrix Receiver to send the appropriate connection request when contacting the appliance for the first time.
  - If users are required to enter their Microsoft Active Directory domain credentials, select Domain.
  - If users are required to enter a tokencode obtained from a security token, select Security token.

- If users are required to enter both their domain credentials and a tokencode obtained from a security token, select Domain and security token.
- If users are required to enter a one-time password sent by text message, select SMS authentication.
- If users are required to present a smart card and enter a PIN, select Smart card.

If you configure smart card authentication with a secondary authentication method to which users can fall back if they experience any issues with their smart cards, select the secondary authentication method from the Smart card fallback list.

11. Enter the NetScaler Gateway authentication service URL in the Callback URL box. This is an optional field. StoreFront automatically appends the standard portion of the URL. Enter the internally accessible URL of the appliance. StoreFront contacts the NetScaler Gateway authentication service to verify that requests received from NetScaler Gateway originate from that appliance.
12. Click Create to add your NetScaler Gateway deployment to the list on the Remote Access page. Repeat Steps 1 to 11, as necessary, to add more NetScaler Gateway deployments to the NetScaler Gateway appliances list. If you enable access through multiple deployments by selecting more than one entry in the list, specify the default deployment to be used to access the store.
13. On the Remote Access page, click Create. Once the store has been created, click Finish.

Your store is now available for users to access with Citrix Receiver, which must be configured with access details for the store. There are a number of ways in which you can provide these details to users to make the configuration process easier for them. For more information, see [User access options](#).

Alternatively, users can access the store through the Receiver for Web site, which enables users to access their desktops and applications through a webpage. The URL for users to access the Receiver for Web site for the new store is displayed when you create the store.

When you create a new store, the XenApp Services URL is enabled by default. Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with users who have older Citrix clients that cannot be upgraded, can access stores directly using the XenApp Services URL for the store. The XenApp Services URL has the form `http[s]://serveraddress/Citrix/storename/PNAgent/config.xml` where `serveraddress` is the FQDN of the server or load balancing environment for your StoreFront deployment and `storename` is the name you specified for the store in Step 3.

### **Create a store for single server deployments on a nondomain-joined server**

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the **Actions** pane, click **Create Store**.

3. On the **Store Name** page, specify a name for your store and click **Next**.  
Store names appear in Citrix Receiver under users' accounts, so choose a name that gives users information about the content of the store.
4. On the **Delivery Controllers** page, list the infrastructure providing the resources that you want to make available in the store. Click **Add**.
5. In the **Add Delivery Controller** dialog box, specify a name that will help you to identify the deployment and indicate whether the resources that you want to make available in the store are provided by XenDesktop, XenApp, or XenMobile AppController. For App Controller deployments, ensure that the name you specify does not contain any spaces.
6. If you are adding details of XenDesktop or XenApp servers, continue to Step 7. To make applications managed by App Controller available in the store, enter the name or IP address of an App Controller virtual appliance in the Server box and specify the port for StoreFront to use for connections to App Controller. The default port is 443. Continue to Step 11.
7. To make desktops and applications provided by XenDesktop or XenApp available in the store, add the name or IP address of your server to the **Servers** box. For XenDesktop sites, give details of Delivery Controllers. In the case of XenApp farms, list the server running the Citrix XML Service.
8. Select from the **Transport type** list the type of connections for StoreFront to use for communications with the server.
  - To send data over unencrypted connections, select HTTP. If you select this option, you must make your own arrangements to secure connections between StoreFront and your server.
  - To send data over secure HTTP connections using Secure Sockets Layer (SSL) or Transport Layer Security (TLS), select HTTPS. If you select this option for XenDesktop and XenApp servers, ensure that the Citrix XML Service is set to share its port with Microsoft Internet Information Services (IIS) and that IIS is configured to support HTTPS.
  - To send data over secure connections to XenApp servers using the SSL Relay to perform host authentication and data encryption, select SSL Relay.

**Note:** If you are using HTTPS or the SSL Relay to secure connections between StoreFront and your server, ensure that the name you specify in the **Servers** box matches exactly (including the case) the name on the certificate for that server.
9. Specify the port for StoreFront to use for connections to the server. The default port is 80 for connections using HTTP and the SSL Relay, and 443 for HTTPS connections. In the case of XenDesktop and XenApp servers, the specified port must be the port used by the Citrix XML Service.  
  
In a Citrix Virtual Apps and Desktops *on-premises* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Delivery Controllers by specifying a

key. For information about key generation, see [Manage security keys](#).

In a Citrix Virtual Apps and Desktops *service* environment, **Shared secret** lets you allow only approved StoreFront machines to communicate with Citrix Cloud by specifying a key. For information about key generation, see [Manage security keys](#).

10. If you are using the SSL Relay to secure connections between StoreFront and the XenApp server, specify the TCP port of the SSL Relay in the SSL Relay port box. The default port is 443. Ensure that all the servers running the SSL Relay are configured to monitor the same port.
11. Click **OK**. You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and App Controller deployments. Repeat Steps 4 to 11, as necessary, to list additional deployments providing resources for the store. When you have added all the required resources to the store, click **Next**.
12. On the **Remote Access** page, specify whether and how users connecting from public networks can access the store through NetScaler Gateway.
  - To make the store unavailable to users on public networks, select **None**. Only local users on the internal network will be able to access the store.
  - To make only resources delivered through the store available through NetScaler Gateway, select **No VPN tunnel**. Users log on directly to NetScaler Gateway and do not need to use the NetScaler Gateway Plug-in.
  - To make the store and all other resources on the internal network available through an SSL virtual private network (VPN) tunnel, select **Full VPN tunnel**. Users require the NetScaler Gateway Plug-in to establish the VPN tunnel.

If it is not already enabled, the pass-through from NetScaler Gateway authentication method is automatically enabled when you configure remote access to the store. Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores.
13. If you enabled remote access, continue to [Provide remote access to the store through NetScaler Gateway](#) to specify the NetScaler Gateway deployments through which users can access the store. Otherwise, on the **Remote Access** page, click **Next**.
14. On the **Configure Authentication Methods** page, select the methods by which users will authenticate and access resources, and click **Next**.
15. On the **Configure Password Validation** page, select the delivery controllers to provide the password validation, click **Next**.
16. On the **XenApp Services URL** page, configure the URL for users who use PNAgent to access application and desktops and click **Create**.

**Server Group Node** in the left and **Action** panes is replaced by **Change Base URL**. The only option available is to change the base URL, because server groups are not available in nondomain-joined servers.

### Remove a store

Use the Remove Store task to delete a store. When you remove a store, any associated Receiver for Web sites, Desktop Appliance sites, and XenApp Services URLs are also deleted.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

## Create an unauthenticated store

October 15, 2018

Use the Create Store task to configure additional unauthenticated stores to support access for unauthenticated (anonymous) users. You can create as many unauthenticated stores as you need; for example, you can create an unauthenticated store for a particular group of users or to group together a specific set of resources.

Remote access through a NetScaler Gateway cannot be applied to unauthenticated stores.

To create an unauthenticated store, you identify and configure communications with the servers providing the resources that you want to make available in the store.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

### Add desktops and applications to the store

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click Create Store.
3. On the Store Name page, specify a name for your store, select **\*\*Allow only unauthenticated (anonymous) users to access this store, \*\*** and click Next.

Store names appear in Citrix Receiver under users' accounts, so choose a name that gives users information about the content of the store.

4. On the **Delivery** Controllers page, list the infrastructure providing the resources that you want to make available in the store. Click Add.
5. In the Add Delivery Controller dialog box, specify a name that will help you to identify the deployment and indicate whether the resources that you want to make available in the store are provided by XenApp or XenMobile (AppController). For XenMobile (AppController) deployments, ensure that the name you specify does not contain any spaces. When assigning Controllers, ensure that you are only using those which support the anonymous apps feature. Configuring your unauthenticated store with Controllers that do not support this feature may lead to no anonymous apps being available from the store.
6. If you are adding details for XenApp servers, continue to Step 7. To make applications managed by XenMobile (App Controller) available in the store, enter the name or IP address of a XenMobile (App Controller) virtual appliance in the Server box and specify the port for StoreFront to use for connections to XenMobile (App Controller). The default port is 443. Continue to Step 10.
7. To make desktops and applications provided by XenApp available in the store, add the names or IP addresses of your servers to the Servers list. Specify multiple servers to enable fault tolerance, listing the entries in order of priority to set the failover sequence. For XenDesktop sites, give details of Controllers. In the case of XenApp farms, list servers running the Citrix XML Service.
8. Select from the Transport type list the type of connections for StoreFront to use for communications with the servers.
  - To send data over unencrypted connections, select HTTP. If you select this option, you must make your own arrangements to secure connections between StoreFront and your servers.
  - To send data over secure HTTP connections using Secure Sockets Layer (SSL) or Transport Layer Security (TLS), select HTTPS. If you select this option for XenDesktop and XenApp servers, ensure that the Citrix XML Service is set to share its port with Microsoft Internet Information Services (IIS) and that IIS is configured to support HTTPS.

Note: If you are using HTTPS to secure connections between StoreFront and your servers, ensure that the names you specify in the Servers list match exactly (including the case) the names on the certificates for those servers.
9. Specify the port for StoreFront to use for connections to the servers. The default port is 80 for connections using HTTP and 443 for HTTPS connections. In the case of XenDesktop and XenApp servers, the specified port must be the port used by the Citrix XML Service.
10. Click OK. You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and App Controller deployments. Repeat Steps 4 to 10, as necessary, to list additional deployments providing resources for the store. When you have added all the required resources

to the store, click Create.

Your unauthenticated store is now available for use. To enable user access to the new store, Citrix Receiver must be configured with access details for the store. There are a number of ways in which you can provide these details to users to make the configuration process easier for them. For more information, see

[User access options](#).

Alternatively, users can access the store through the Receiver for Web site, which enables users to access their desktops and applications through a web page. By default with unauthenticated stores, Receiver for Web displays the applications in a folder hierarchy that includes a breadcrumb path. The URL for users to access the Receiver for Web site for the new store is displayed when you create the store.

When you create a new store, the XenApp Services URL is enabled by default. Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with users who have older Citrix clients that cannot be upgraded, can access stores directly using the XenApp Services URL for the store. The XenApp Services URL has the form `http[s]://serveraddress/Citrix/storename/PNAgent/config.xml` where `serveraddress` is the FQDN of the server or load balancing environment for your StoreFront deployment and `storename` is the name you specified for the store in Step 3.

Note: In StoreFront configurations where the `web.config` file has been configured with the parameter `LogoffAction="terminate"`, Citrix Receiver for Web sessions accessing this unauthenticated store will not terminate. Typically, the `web.config` file can be found at `C:\inetpub\wwwroot\Citrix\storename\`, where `storename` is the name specified for the store when it was created. To ensure these sessions terminate properly, the XenApp server being used by this store must have the Trust XML requests option enabled as shown in

*Configuring the Citrix XML Service Port and Trust* in the XenApp and XenDesktop documentation.

## Export store provisioning files for users

October 15, 2018

Use the Export Multi-Store Provisioning File and Export Provisioning File tasks to generate files containing connection details for stores, including any NetScaler Gateway deployments and beacons configured for the stores. Make these files available to users to enable them to configure Citrix Receiver automatically with details of the stores. Users can also obtain Citrix Receiver provisioning files from Receiver for Web sites.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete,

[propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile. Select the Stores node in the left pane of the Citrix StoreFront management console.
2. To generate a provisioning file containing details for multiple stores, in the Actions pane, click Export Multi-Store Provisioning File and select the stores to include in the file.
3. Click Export and Save the provisioning file with a .cr extension to a suitable location on your network.

## Advertise and hide stores to users

October 15, 2018

Use the Hide Store task to prevent stores being presented to users to add to their accounts when they configure Citrix Receiver through email-based account discovery or FQDN. By default, when you create a store it is presented as an option for users to add in Citrix Receiver when they discover the StoreFront deployment hosting the store. Hiding a store does not make it inaccessible, instead users must configure Citrix Receiver with connection details for the store, either manually, using a setup URL, or with a provisioning file. To resume advertising a hidden store, use the Advertise Store task.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the **Actions** pane, click **Configure Store Settings > Advertise Store**.
3. On the **Advertise Store** page, select either **Advertise Store** or **Hide Store**.

## Manage the resources made available in stores

October 15, 2018

Use the Manage Controllers task to add and remove from stores resources provided by XenDesktop, XenApp, and App Controller, and to modify the details of the servers providing these resources.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running

on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the Actions pane, click Manage Delivery Controllers.
3. In the Manage Delivery Controllers dialog box, click Add to include desktops and applications from another XenDesktop, XenApp, or App Controller deployment in the store. To modify the settings for a deployment, select the entry in the Delivery controllers list and click Edit. Select an entry in the list and click Remove to stop the resources provided by the deployment being available in the store.
4. In the Add Controller or Edit Controller dialog box, specify a name that will help you to identify the deployment and indicate whether the resources that you want to make available in the store are provided by XenDesktop, XenApp, or AppController. For App Controller deployments, ensure that the name you specify does not contain any spaces.
5. If you are adding details of XenDesktop or XenApp servers, continue to Step 6. To make applications managed by App Controller available in the store, enter the name or IP address of an App Controller virtual appliance in the Server box and specify the port for StoreFront to use for connections to App Controller. The default port is 443. Continue to Step 10.
6. To make desktops and applications provided by XenDesktop or XenApp available in the store, click Add to enter the name or IP address of a server. Depending on how the web.config file is configured, specifying multiple servers enables either load balancing or failover, as indicated in the dialog box. Load balancing is configured by default. If failover is configured, list the entries in order of priority to set the failover sequence. For XenDesktop sites, give details of Delivery Controllers. In the case of XenApp farms, list servers running the Citrix XML Service. To modify the name or IP address of a server, select the entry in the Servers list and click Edit. Select an entry in the list and click Remove to stop StoreFront contacting the server to enumerate the resources available to the user.
7. Select from the Transport type list the type of connections for StoreFront to use for communications with the servers.
  - To send data over unencrypted connections, select HTTP. If you select this option, you must make your own arrangements to secure connections between StoreFront and your servers.
  - To send data over secure HTTP connections using Secure Sockets Layer (SSL) or Transport Layer Security (TLS), select HTTPS. If you select this option for XenDesktop and XenApp servers, ensure that the Citrix XML Service is set to share its port with Microsoft Internet Information Services (IIS) and that IIS is configured to support HTTPS.
  - To send data over secure connections to XenApp servers using the SSL Relay to perform host authentication and data encryption, select SSL Relay.

Note: If you are using HTTPS or the SSL Relay to secure connections between StoreFront and your servers, ensure that the names you specify in the Servers list match exactly (including the case) the names on the certificates for those servers.

8. Specify the port for StoreFront to use for connections to the servers. The default port is 80 for connections using HTTP and the SSL Relay, and 443 for HTTPS connections. In the case of XenDesktop and XenApp servers, the specified port must be the port used by the Citrix XML Service.
9. If you are using the SSL Relay to secure connections between StoreFront and XenApp servers, specify the TCP port of the SSL Relay in the SSL Relay port box. The default port is 443. Ensure that all the servers running the SSL Relay are configured to monitor the same port.
10. Click OK. You can configure stores to provide resources from any mixture of XenDesktop, XenApp, and App Controller deployments. Repeat Steps 3 to 10, as necessary, to add or modify other deployments in the Delivery controllers list.

## Manage remote access to stores through NetScaler Gateway

October 15, 2018

Use the Remote Access Settings task to configure access to stores through NetScaler Gateway for users connecting from public networks. Remote access through a NetScaler Gateway cannot be applied to unauthenticated stores.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the Actions pane, click **Configure** Remote Access Settings.
3. In the **Configure** Remote Access Settings dialog box, specify whether and how users connecting from public networks can access the store through NetScaler Gateway.
  - To make the store unavailable to users on public networks, make sure you do not check **Enable remote access**. Only local users on the internal network will be able to access the store.
  - To enable remote access, check **Enable Remote Access**.
    - To make only resources delivered through the store available through NetScaler Gateway, select No VPN tunnel. Users log on directly to NetScaler Gateway and do not

need to use the NetScaler Gateway Plug-in.

- To make the store and other resources on the internal network available through a Secure Sockets Layer (SSL) virtual private network (VPN) tunnel, select Full VPN tunnel. Users require the NetScaler Gateway Plug-in to establish the VPN tunnel.

If it is not already enabled, the pass-through from NetScaler Gateway authentication method is automatically enabled when you configure remote access to the store. Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores.

4. If you enabled remote access, select from the NetScaler Gateway appliances list the deployments through which users can access the store. Any deployments you configured previously for this and other stores are available for selection in the list. If you want to add a further deployment to the list, click Add. Otherwise, continue to Step 16.
5. On the General Settings page, specify a name for the NetScaler Gateway deployment that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that deployment. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

6. Enter the URL of the virtual server or user logon point (for Access Gateway 5.0) for your deployment. Specify the product version used in your deployment.

The fully qualified domain name (FQDN) for your StoreFront deployment must be unique and different from the NetScaler Gateway virtual server FQDN. Using the same FQDN for StoreFront and the NetScaler Gateway virtual server is not supported.

7. If you are adding an Access Gateway 5.0 deployment, continue to Step 9. Otherwise, specify the subnet IP address of the NetScaler Gateway appliance, if necessary. A subnet IP address is required for Access Gateway 9.3 appliances, but optional for more recent product versions.

The subnet address is the IP address that NetScaler Gateway uses to represent the user device when communicating with servers on the internal network. This can also be the mapped IP address of the NetScaler Gateway appliance. Where specified, StoreFront uses the subnet IP address to verify that incoming requests originate from a trusted device.

8. If you are adding an appliance running NetScaler Gateway 11, NetScaler Gateway 10.1, Access Gateway 10, or Access Gateway 9.3, select from the Logon type list the authentication method you configured on the appliance for Citrix Receiver users.

The information you provide about the configuration of your NetScaler Gateway appliance is added to the provisioning file for the store. This enables Citrix Receiver to send the appropriate connection request when contacting the appliance for the first time.

- If users are required to enter their Microsoft Active Directory domain credentials, select Domain.
- If users are required to enter a tokencode obtained from a security token, select Security token.
- If users are required to enter both their domain credentials and a tokencode obtained from a security token, select Domain and security token.
- If users are required to enter a one-time password sent by text message, select SMS authentication.
- If users are required to present a smart card and enter a PIN, select Smart card.

If you configure smart card authentication with a secondary authentication method to which users can fall back if they experience any issues with their smart cards, select the secondary authentication method from the Smart card fallback list. Continue to Step 10.

9. To add an Access Gateway 5.0 deployment, indicate whether the user logon point is hosted on a standalone appliance or an Access Controller server that is part of a cluster. If you are adding a cluster, click Next and continue to Step 11.
10. If you are configuring StoreFront for NetScaler Gateway 11, NetScaler Gateway 10.1, Access Gateway 10, Access Gateway 9.3, or a single Access Gateway 5.0 appliance, complete the NetScaler Gateway authentication service URL in the Callback URL box. StoreFront automatically appends the standard portion of the URL. Click Next and continue to Step 13.

Enter the internally accessible URL of the appliance. StoreFront contacts the NetScaler Gateway authentication service to verify that requests received from NetScaler Gateway originate from that appliance.

11. To configure StoreFront for an Access Gateway 5.0 cluster, list on the Appliances page the IP addresses or FQDNs of the appliances in the cluster and click Next.
12. On the Enable Silent Authentication page, list URLs for the authentication service running on the Access Controller servers. Add URLs for multiple servers to enable fault tolerance, listing the servers in order of priority to set the failover sequence. Click Next.

StoreFront uses the authentication service to authenticate remote users so that they do not need to re-enter their credentials when accessing stores.

13. For all deployments, if you are making resources provided by XenDesktop or XenApp available in the store, list on the Secure Ticket Authority (STA) page URLs for servers running the STA. Add URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence.

The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

14. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the Enable session reliability check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the Request tickets from two STAs, where available check box.

When the Request tickets from two STAs, where available check box is selected, StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.

15. Click Create to add your NetScaler Gateway deployment to the list in the Remote Access Settings dialog box.
16. Repeat Steps 4 to 15, as necessary, to add more NetScaler Gateway deployments to the NetScaler Gateway appliances list. If you enable access through multiple deployments by selecting more than one entry in the list, specify the default deployment to be used to access the store.

## **Configure two StoreFront stores to share a common subscription datastore**

November 5, 2018

As of version 2.0, StoreFront no longer uses an SQL database to maintain its subscription data. Citrix replaced the SQL database with a Windows datastore that requires no additional configuration when StoreFront is first installed. The installation installs the Windows datastore locally on each StoreFront server. In StoreFront server group environments, each server also maintains a copy of the subscription data used by its store. This data is propagated to other servers to maintain user subscriptions across the whole group. By default, StoreFront creates a single datastore for each store. Each subscription datastore is updated independently from each other store.

Where different configuration settings are required, it is common for administrators to configure StoreFront with two distinct stores; one for external access to resources using Netscaler Gateway and another for internal access using the corporate LAN. You can configure both “external” and “internal” stores to share a common subscription datastore by making a simple change to the store web.config file.

In the default scenario involving two stores and their corresponding subscription datastores, a user must subscribe to the same resource twice. Configuring the two stores to share a common subscription database improves and simplifies the roaming experience when users access the same resource from inside or outside the corporate network. With a shared subscription datastore it does not matter whether they use the “external” or “internal” store when they initially subscribe to a new resource.

- Each store has a web.config file located in C:\inetpub\wwwroot\citrix\<storename>.
- Each store web.config contains a client endpoint for the Subscription Store Service.

```

1 <clientEndpoint uri="net.pipe://localhost/Citrix/Subscriptions/1
  __Citrix_<StoreName>" authenticationMode="windows" transferMode="
  Streamed">
2 <!--NeedCopy-->

```

The subscription data for each Store is located in C:\Windows\ServiceProfiles\NetworkService\AppData\Roaming\

For two stores to share a subscription datastore, you need only point one store to the subscription service end point of the other store. In the case of a server group deployment, all servers have identical pairs of stores defined and identical copies of the shared datastore they both share.

Note: The XenApp, XenDesktop and AppC controllers configured on each store must match exactly; otherwise, an inconsistent set of resource subscriptions on one store compared to another might occur. Sharing a datastore is supported only when the two stores reside on the same StoreFront server or server group deployment.

### StoreFront subscription datastore endpoints

1. On a single StoreFront deployment, open the external store web.config file using Notepad and search for the clientEndpoint. For example:

```

1 <subscriptionsStoreClient enabled="true">
2 <clientEndpoint uri="net.pipe://localhost/Citrix/Subscriptions/1
  __Citrix_External" authenticationMode="windows" transferMode="
  Streamed">
3 <clientCertificate thumbprint="0" />
4 </clientEndpoint>
5 </subscriptionsStoreClient>
6 <!--NeedCopy-->

```

2. Change the external to match the internal store endpoint:

```

1 <subscriptionsStoreClient enabled="true">
2 <clientEndpoint uri="net.pipe://localhost/Citrix/Subscriptions/1
  __Citrix_Internal" authenticationMode="windows" transferMode="
  Streamed">
3 <clientCertificate thumbprint="0" />
4 </clientEndpoint>
5 </subscriptionsStoreClient>
6 <!--NeedCopy-->

```

3. If using StoreFront server group then propagate any changes made to the web.config file of the primary node to all other nodes.

Both stores are now set to share the internal store subscription datastore.

## Store subscription data using Microsoft SQL Server

November 13, 2019

### Note:

This document assumes basic knowledge of MS SQL server and T-SQL queries. Administrators must be comfortable configuring, using, and administering SQL server before attempting to follow this document.

### Introduction

ESENT is an embeddable, transactional database engine which Windows can use. All versions of StoreFront support the use of a built in ESENT database by default. They can also connect to a Microsoft SQL server instance if the store is configured to use an SQL connection string.

The main advantage of switching StoreFront to using SQL instead of ESENT is that T-SQL update statements allow you to manage, modify, or delete subscription records. If you use SQL, you do not need to export, modify and re import the entire ESENT subscription data whenever minor changes to the subscription data are performed.

To migrate existing subscription data from ESENT to Microsoft SQL server, the flat ESENT data exported from StoreFront needs to be transformed into an SQL friendly format for bulk import. For new deployments without any new subscription data, this step is not required. The data transformation step is only needed once. This article describes the supported configuration which can be used in all StoreFront versions from version 3.5, which introduced the -STF PowerShell SDK referenced in the article.

### Note:

Failures to connect to the SQL server instance used by StoreFront to store the subscription data due to network outages do not render the StoreFront deployment unusable. Outages only result in a temporarily degraded user experience; users cannot add, remove, or view favorite resources until the connection to SQL server is restored. Resources can still be enumerated and launched during the outage. The expected behavior is the same as if the Citrix Subscription Store service were to stop while using ESENT.

### Tip:

Resources configured with KEYWORDS:Auto or KEYWORDS:Mandatory behave the same way when using both ESENT or SQL. New SQL subscription records are created automatically when

a user first logs on if either KEYWORD is included in the user's resources.

### Advantages of ESENT and SQL server

ESENT	SQL
Default and requires no addition configuration to use StoreFront "out of the box".	Much more manageable and subscription data can be manipulated or updated easily using T-SQL queries. Allows records per user to be deleted or updated Allows easy means to count records per application, delivery controller or user. Allows easy means to remove unnecessary user data for users who have left the company/organization. Allows easy means to update delivery controller references such as when the admin switches to using aggregation or new delivery controllers are provisioned.
Simpler to configure replication between different server groups using subscription syncing and pull schedules. See <a href="#">Configure subscription synchronization</a>	Decoupled from StoreFront so no need to back up the subscription data before StoreFront upgrade as the data is maintained on a separate SQL server. Subscription backup is independent of StoreFront and uses SQL backup strategies and mechanisms.
SQL unnecessary when subscription management is not needed. If the subscription data will never need updating, ESENT is likely to meet customer needs.	Single copy of the subscription data shared by all members of the server group so less chance of data differences between servers or data syncing issues.

### Disadvantages of ESENT and SQL server

ESENT	SQL
<p>No easy means to manage subscription data easily and in a granular manner. Requires subscription manipulations to be done in exported .txt files. The whole subscription database must be exported and re imported. Potentially thousands of records may need to be changed using find and replace techniques, which is labor intensive and potentially error prone.</p>	<p>Requires basic SQL expertise and infrastructure. Can require an SQL license to be purchased, which increases total cost of ownership of StoreFront deployment. Although a Citrix Virtual Apps and Desktops database instance can also be shared with StoreFront to reduce costs.</p>
<p>A copy of the ESENT database must be maintained on each StoreFront server within a server group. On rare occasions this database can get out of sync within a server group or between different server groups.</p>	<p>Replicating subscription data between server groups is a non-trivial deployment task. It requires multiple SQL instances and transaction replication between each of them per data center. This requires specialized MS SQL expertise.</p>
	<p>Data migration from ESENT and transformation to SQL friendly format required. This process is only required once.</p>
	<p>Extra windows servers and licenses may be needed.</p>
	<p>Extra steps to deploy StoreFront.</p>

## Deployment scenarios

### Note:

Each store configured within StoreFront requires either an ESENT database or a Microsoft SQL database if you want to support user subscriptions. The method of storing the subscription data is set at the store level within StoreFront.

Citrix recommended all store databases reside on the same Microsoft SQL server instance to reduce management complexity and reduce the scope for misconfiguration.

Multiple stores can share the same database, provided they are all configured to use the same identical connection string. It does not matter if they use different delivery controllers. The disadvantage of multiple stores sharing a database is that there is no way to tell which store each subscription record corresponds to.

A combination of the two data storage methods is technically possible on a single StoreFront deployment with multiple stores. It is possible to configure one store to use ESENT and another to use SQL.

This is not recommended due to increased management complexity and the scope for misconfiguration.

There are four scenarios you can use for storing subscription data in SQL

Server:

**Scenario 1: Single StoreFront Server or Server Group using ESENT (default)**

By default, all versions of StoreFront since version 2.0 use a flat ESENT database to store and replicate subscription data between members of a server group. Each member of the server group maintains an identical copy of the subscription database, which is synced with all other members of the server group. This scenario requires no additional steps to configure. This scenario is suitable for most customers who do not expect frequent changes to Delivery Controller names or do not need to perform frequent management tasks on their subscription data like removing or updating old user subscriptions.

**Scenario 2: Single StoreFront Server and a local Microsoft SQL server instance installed**

StoreFront uses a locally installed SQL server instance and both components reside on the same server. This scenario is suitable for a simple single StoreFront deployment where customers might need to make frequent changes to Delivery Controller names, or they need to perform frequent management tasks on their subscription data like removing or updating old user subscriptions, but they do not require a high availability StoreFront deployment. Citrix do not recommend this scenario for server groups because it creates a single point of failure on the server group member that hosts the Microsoft SQL database instance. This scenario is not suitable for large enterprise deployments.

**Scenario 3: StoreFront server group and a dedicated Microsoft SQL server instance configured for high availability (recommended)**

All StoreFront server group members connect to the same dedicated Microsoft SQL server instance or SQL failover cluster. This is the most suitable model for large enterprise deployments where Citrix administrators want to make frequent changes to delivery controller names or want to perform frequent management tasks on their subscription data like removing or updating old user subscriptions and require high availability.

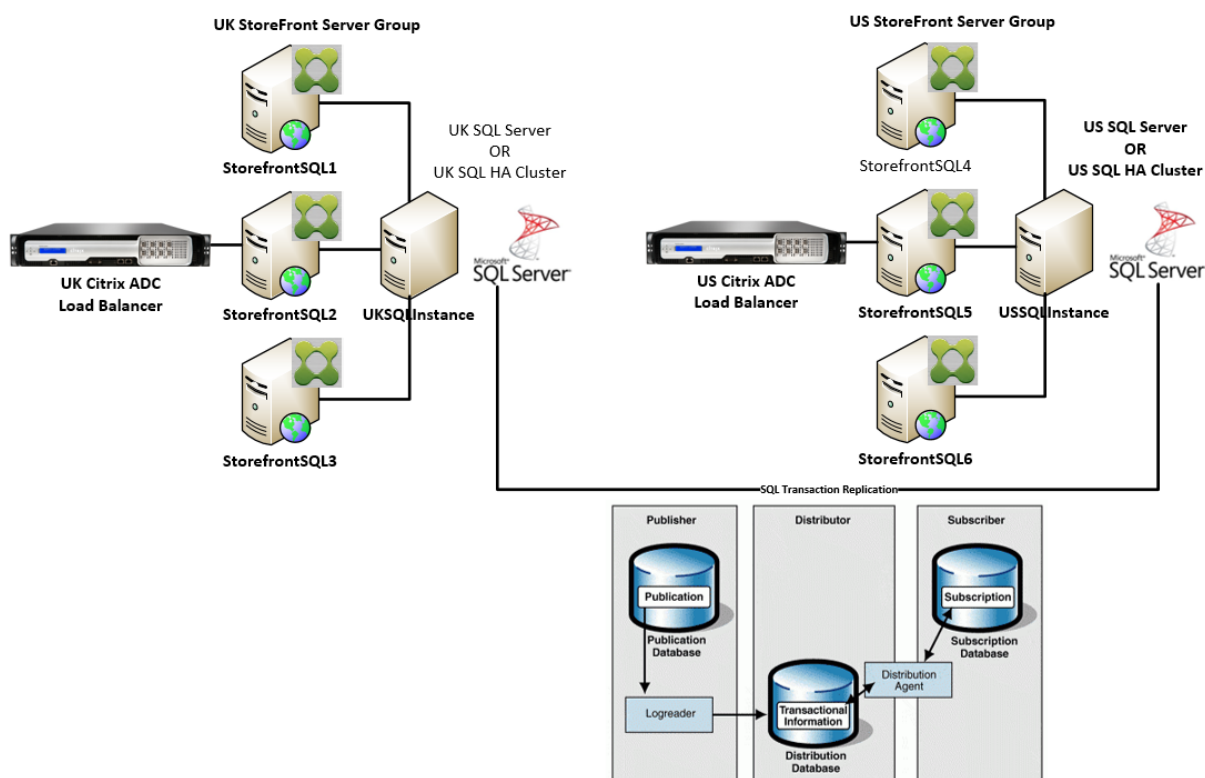

#### Scenario 4: Multiple StoreFront server groups and a dedicated Microsoft SQL server instance in each data center per server group

**Note:**

This is an advanced configuration. Only attempt it if you are an experienced SQL server administrator familiar with transaction replication, and you have the necessary skills to deploy it successfully.

This is the same as scenario 3, but extends it to situations where multiple StoreFront server groups are required in different remote data centers. Citrix Administrators may choose to synchronize subscription data between different server groups in the same or different data centers. Each server group in the data center connects to its own dedicated Microsoft SQL server instance for redundancy, failover, and performance. This scenario requires considerable extra Microsoft SQL server configuration and infrastructure. It relies entirely on Microsoft SQL technology to replicate the subscription data and its SQL transactions.

## Resources

You can download the following scripts from <https://github.com/citrix/sample-scripts/tree/master/storefront> to help you:

## Configuration scripts

- **Set-STFDatabase.ps1** – sets the MS SQL connection string for each Store. Run on the StoreFront server.
- **Add-LocalAppPoolAccounts.ps1** – grants the local StoreFront server’s app pools read and write access to the SQL database. Run for scenario 2 on the SQL server.
- **Add-RemoteSFAccounts.ps1** – grants the all StoreFront servers in a server group read and write access to the SQL database. Run for scenario 3 on the SQL server.
- **Create-StoreSubscriptionsDB-2016.sql** – creates the SQL database and schema. Run on the SQL server.

## Data transformation and import scripts

- **Transform-SubscriptionDataForStore.ps1** – exports and transforms existing subscription data within ESENT into an SQL friendly format for import.

- **Create-ImportSubscriptionDataSP.sql** – creates a stored procedure to import the data transformed by Transform-SubscriptionDataForStore.ps1. Run this script once on the SQL server after you have created the database schema using Create-StoreSubscriptionsDB-2016.sql.

## Configure the StoreFront server's local security group on the SQL Server

### Scenario 2: Single StoreFront Server and a local Microsoft SQL server instance installed

Create a local security group called <SQLServer>\StoreFrontServers on the Microsoft SQL server, and add the virtual accounts for the IIS APPPOOL\DefaultAppPool and IIS APPPOOL\Citrix Receiver for Web to allow the locally installed StoreFront to read and write to SQL. This security group is referenced in the .SQL script that creates the store subscription database schema, so ensure that the group name matches.

You can download the script [Add-LocalAppPoolAccounts.ps1](#) to help you.

Install StoreFront before running the *Add-LocalAppPoolAccounts.ps1* script. The script depends on the ability to locate the IIS APPPOOL\Citrix Receiver for Web virtual IIS account, which does not exist until StoreFront has been installed and configured. IIS APPPOOL\DefaultAppPool is created automatically by installing the IIS webserver role.

```

1 # Create Local Group for StoreFront servers on DB Server
2 $LocalGroupName = "StoreFrontServers"
3 $Description = "Contains StoreFront Server Machine Accounts or
   StoreFront AppPool Virtual Accounts"
4
5 # Check whether the Local Group Exists
6 if ([ADSI]::Exists("WinNT://$env:ComputerName/$LocalGroupName"))
7 {
8
9     Write-Host "$LocalGroupName already exists!" -ForegroundColor "
   Yellow"
10 }
11
12 else
13 {
14
15 Write-Host "Creating $LocalGroupName local security group" -
   ForegroundColor "Yellow"
16
17 # Create Local User Group
18 $Computer = [ADSI]"WinNT://$env:ComputerName,Computer"
19 $LocalGroup = $Computer.Create("group",$LocalGroupName)
20 $LocalGroup.setinfo()
21 $LocalGroup.description = $Description

```

```
22 $Localgroup.SetInfo()
23 Write-Host "$LocalGroupName local security group created" -
    ForegroundColor "Green"
24 }
25
26 $Group = [ADSI]"WinNT://$env:ComputerName/$LocalGroupName,group"
27
28 # Add IIS APPPOOL\DefaultAppPool
29 $objAccount = New-Object System.Security.Principal.NTAccount("IIS
    APPPOOL\DefaultAppPool")
30 $StrSID = $objAccount.Translate([System.Security.Principal.
    SecurityIdentifier])
31 $DefaultSID = $StrSID.Value
32
33 $Account = [ADSI]"WinNT://$DefaultSID"
34 $Group.Add($Account.Path)
35
36 # Add IIS APPPOOL\Citrix Receiver for Web
37 $objAccount = New-Object System.Security.Principal.NTAccount("IIS
    APPPOOL\Citrix Receiver for Web")
38 $StrSID = $objAccount.Translate([System.Security.Principal.
    SecurityIdentifier])
39 $WebRSID = $StrSID.Value
40
41 $Account = [ADSI]"WinNT://$WebRSID"
42 $Group.Add($Account.Path)
43
44 Write-Host "AppPools added to $LocalGroupName local group" -
    ForegroundColor "Green"
45 <!--NeedCopy-->
```

Enable named pipes within your local SQL instance using SQL server configuration manager. Named pipes are required for interprocess communication between StoreFront and SQL server.

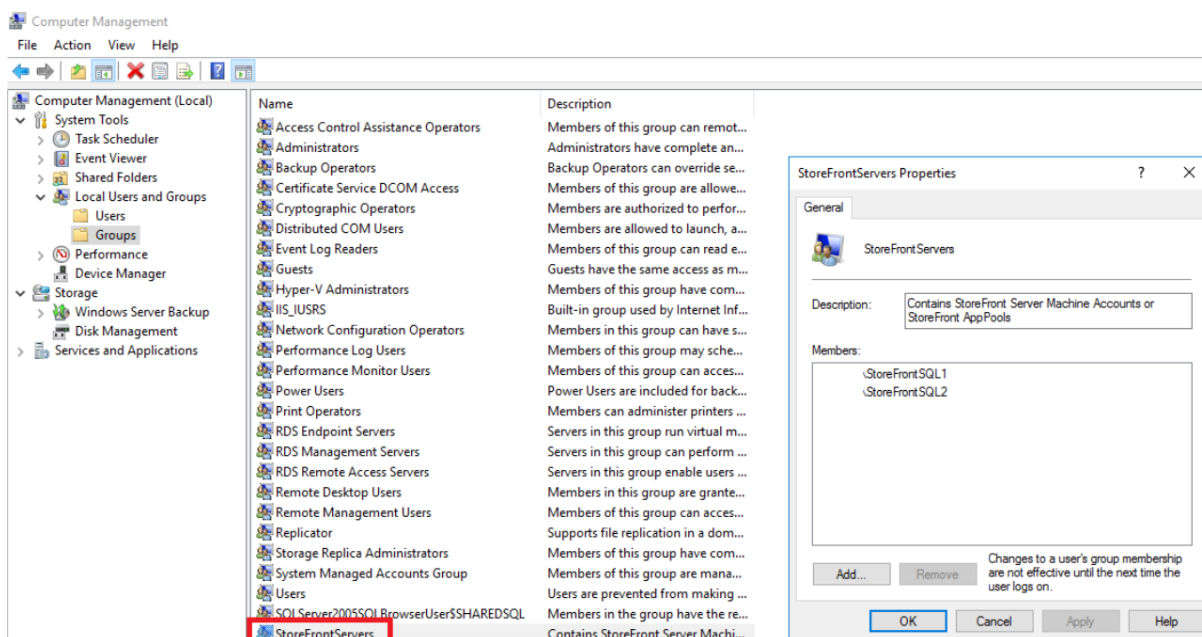

Ensure the Windows firewall rules are correctly configured to allow SQL server connections using either a specific port or dynamic ports. Refer to Microsoft documentation for how to do this in your environment.

**Tip:**

If connection to the local SQL instance fails, check that localhost or <hostname> used in the connection string resolves to the correct IPv4 address. Windows may attempt to use IPv6 instead of IPv4, and DNS resolution of localhost may return ::1 instead of the correct IPv4 address of the StoreFront and SQL server. Completely disabling the IPv6 network stack on the host server may be required to resolve this problem.

**Scenario 3: StoreFront server group and a dedicated Microsoft SQL server instance**

Create a local security group called <SQLServer>\StoreFrontServers on the Microsoft SQL server and add all members of the StoreFront server group. This security group is referenced later in the **Create-StoreSubscriptionsDB-2016.sql** script that creates the subscription database schema within SQL.

Add all StoreFront server group domain computer accounts to the `<SQLServer>\StoreFrontServers` group. Only StoreFront server domain computer accounts listed in the group will be able to read and write subscription records in SQL if Windows authentication is used by SQL server. The following PowerShell function, provided in script [Add-RemoteSFAccounts.ps1](#), creates the local security group and adds two StoreFront servers to it named StoreFrontSQL1 and StoreFrontSQL2.

```

1 function Add-RemoteSTFMachineAccounts
2 {
3
4 [CmdletBinding()]
5 param([Parameter(Mandatory=$True)][string]$Domain,
6 [Parameter(Mandatory=$True)][array]$StoreFrontServers)
7
8 # Create Local Group for StoreFront servers on DB Server
9 $LocalGroupName = "StoreFrontServers"
10 $Description = "Contains StoreFront Server Machine Accounts or
11 StoreFront AppPool virtual accounts"
12
13 # Check whether the Local Security Group already exists
14 if ([ADSI]::Exists("WinNT://$env:ComputerName/$LocalGroupName"))
15 {
16     Write-Host "$LocalGroupName already exists!" -ForegroundColor "
17     Yellow"
18 }
19 else

```

```
20 {
21
22     Write-Host "Creating $LocalGroupName local group" -ForegroundColor
        "Yellow"
23
24     # Create Local Security Group
25     $Computer = [ADSI]"WinNT://$env:ComputerName,Computer"
26     $LocalGroup = $Computer.Create("group",$LocalGroupName)
27     $LocalGroup.setinfo()
28     $LocalGroup.description = $Description
29     $Localgroup.SetInfo()
30 Write-Host "$LocalGroupName local group created" -ForegroundColor "
    Green"
31 }
32
33 Write-Host "Adding $StoreFrontServers to $LocalGroupName local group" -
    ForegroundColor "Yellow"
34
35 foreach ($StoreFrontServer in $StoreFrontServers)
36 {
37
38     $Group = [ADSI]"WinNT://$env:ComputerName/$LocalGroupName,group"
39     $Computer = [ADSI]"WinNT://$Domain/$StoreFrontServer$"
40     $Group.Add($Computer.Path)
41 }
42
43 Write-Host "$StoreFrontServers added to $LocalGroupName" -
    ForegroundColor "Green"
44 }
45
46 Add-RemoteSTFMachineAccounts -Domain "example" -StoreFrontServers @"(
    StoreFrontSQL1","StoreFrontSQL2")
47 <!--NeedCopy-->
```

### Configure the subscription database schema within Microsoft SQL Server for each store

Create a named instance on your Microsoft SQL server for use by StoreFront. Set the path within the .SQL script to correspond to where your version of SQL is installed, or its database files are stored. The example script [Create-StoreSubscriptionsDB-2016.sql](#) uses SQL Server 2016 Enterprise.

Create an empty database using SQL Server Management Studio (SSMS) by right clicking **Databases** then selecting **New Database**.

Type a **Database name** to match your store, or choose a different name such as *STFSubscriptions*.

Before running the script, for each store in your StoreFront deployment, modify the references in the example script to match your StoreFront and SQL deployments. For example, modify:

- Name each database you create to match the store name in `USE [STFSubscriptions]`.
- Set the path to the database .mdf and .ldf files to where you want to store the database.

```
C:\Program Files\Microsoft SQL Server\MSSQL13.SQL2016\MSSQL\DATA\
STFSubscriptions.mdf
```

```
C:\Program Files\Microsoft SQL Server\MSSQL13.SQL2016\MSSQL\DATA\
```

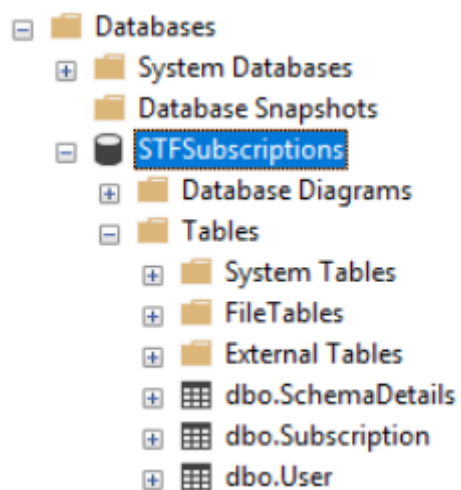

STFSubscriptions.ldf

- Set the reference to your SQL server's name within the script:

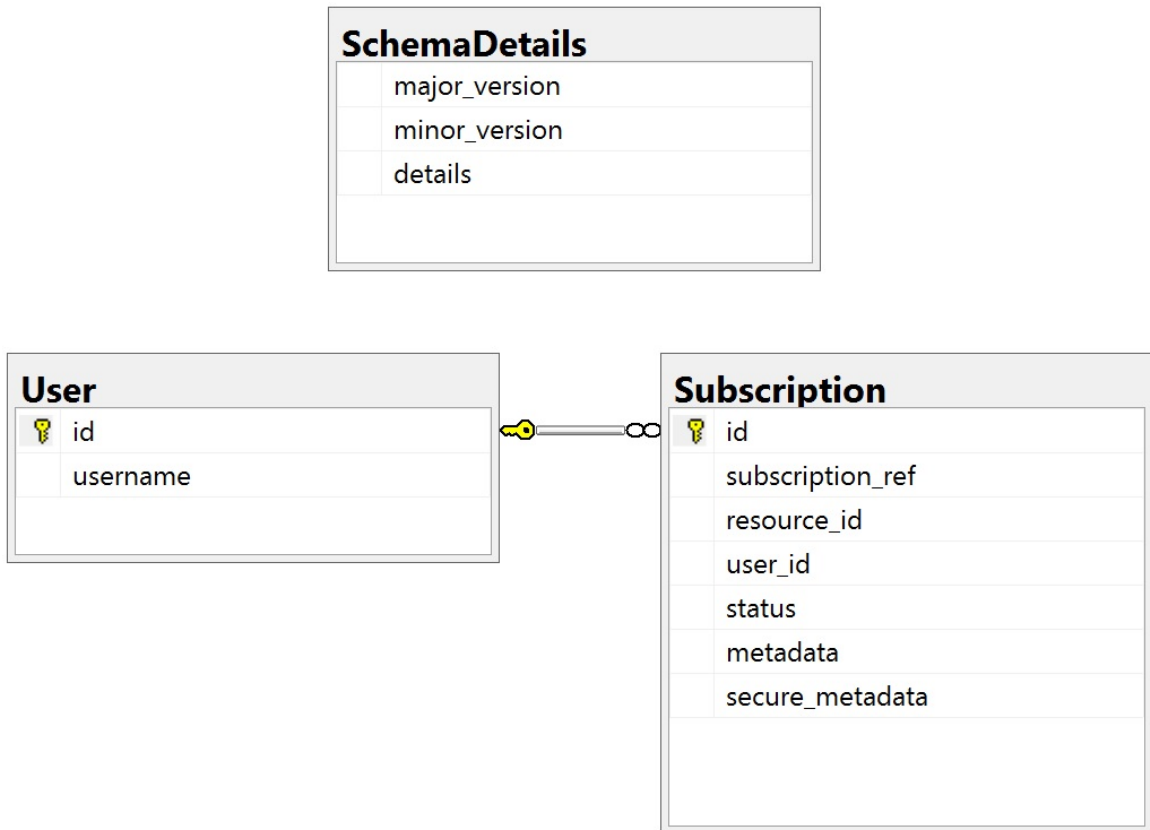

```
CREATE LOGIN [SQL2016\StoreFrontServers] FROM WINDOWS;
```

```
ALTER LOGIN [SQL2016\StoreFrontServers]
```

Run the script. After successful configuration of the schema, three database tables are created: *SchemaDetails*, *Subscription*, and *User*.

The following database diagram shows the subscriptions database schema that the *Create-StoreSubscriptionsDB-2016.sql* script creates:

## Configure the SQL Server Connection String for each StoreFront store

### Scenario 1

#### Tip:

The original subscription data stored on disk in the ESENT database is not destroyed or removed. If you decide to revert from Microsoft SQL server to using ESENT, it is possible to remove the store connection string and simply switch back to using the original data. Any additional subscriptions that were created while SQL was in use for the store will not exist in ESENT and users will not see these new subscription records. All original subscriptions records will still be present.

### To re-enable ESENT subscriptions on a store

Open the PowerShell ISE and select **Run as Administrator**.

Use the **-UseLocalStorage** option to specify the store you want to re-enable ESENT subscriptions on:

```

1 $SiteID = 1
2 $StoreVirtualPath = "/Citrix/Store1"
3
  
```

```
4 # Sets SQL DB Connection String
5 $StoreObject = Get-STFStoreService -SiteID $SiteID -VirtualPath
   $StoreVirtualPath
6
7 # Removes the SQL DB Connection string and reverts back to using ESENT
8 Set-STFStoreSubscriptionsDatabase -StoreService $StoreObject -
   UseLocalStorage
9 Get-STFStoreSubscriptionsDatabase -StoreService $StoreObject
10 <!--NeedCopy-->
```

### Scenarios 2, 3 and 4

Open the PowerShell ISE and select **Run as Administrator**.

Specify the store you want to set a connection string for using **\$StoreVirtualPath**

```
1 $SiteID = 1
2 $VirtualPath= "/Citrix/Store1"
3 $DBName = "Store1"
4 $DBServer = "SQL2016Ent"
5 $DBLocalServer = "localhost"
6 $DBInstance = "StoreFrontInstance"
7
8 # For a remote database instance
9 $ConnectionString = "Server=$DBServer\${SQLInstance};Database=$DBName;
   Trusted_Connection=True;" Database=$DBName;Trusted_Connection=True;"
10 <!--NeedCopy-->
```

OR

```
1 # For a locally installed database instance
2 $ConnectionString = "$DBLocalServer\${SQLInstance};Database=$DBName;
   Trusted_Connection=True;"
3
4 # Sets SQL DB Connection String
5 $StoreObject = Get-STFStoreService -SiteID $SiteID -VirtualPath "/"
   Citrix/Store"
6 Set-STFStoreSubscriptionsDatabase -StoreService $StoreObject -
   ConnectionString $ConnectionString
7 Get-STFStoreSubscriptionsDatabase -StoreService $StoreObject
8 <!--NeedCopy-->
```

Repeat the process for every store in your deployment if you want to configure them all to use an SQL connection string.

## Migrate existing data from ESENT into Microsoft SQL Server

To migrate your existing ESENT data to SQL a two-step data transformation process is required. Two scripts are provided to assist you in performing this one-time operation. If the connection string in StoreFront and the SQL instance are correctly configured, then all new subscriptions are created automatically within SQL in the correct format. After migration, the historic ESENT subscription data is transformed into an SQL format and users can also see their previously subscribed resources.

### Example: four SQL subscriptions for the same domain user

id	subscription_ref	resource_id	user_id	status	metadata	secret_metadata
1	D002B848A48917585CC09F924705	XenDesktopSSL_Noteepad++_TLS	1	1	<SubscriptionProperties xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"><property key="device position"><value>1</value></property></SubscriptionProperties>	NULL
2	2A3C24FE0F14E074D3C7B83CC8110E7	XenDesktopSSL_Windows Media Player_TLS	1	1	<SubscriptionProperties xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"><property key="device position"><value>2</value></property></SubscriptionProperties>	NULL
3	429E64F9102864C30098E2D0942C23	XenDesktopSSL_Calculator_TLS	1	1	<SubscriptionProperties xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"><property key="device position"><value>3</value></property></SubscriptionProperties>	NULL
4	9632ACE3170D118E1EF79C5A269299CA	XenDesktopSSL_IE11_TLS	1	1	<SubscriptionProperties xmlns:xsd="http://www.w3.org/2001/XMLSchema" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"><property key="device position"><value>4</value></property></SubscriptionProperties>	NULL

id	username	count
1	ES1521	4093

### Step 1 Use the Transform-SubscriptionDataForStore.ps1 script to convert the ESENT data into an SQL friendly format for bulk import

Log into the StoreFront server that you want to transform ESENT data from.

Any member of a server group is suitable provided they all contain the same number of subscription records.

Open the PowerShell ISE and select **Run as Administrator**.

Run the script [Transform-SubscriptionDataForStore.ps1](#) which exports a <StoreName>.txt file from the ESENT database to the current user's desktop.

The PowerShell script provides verbose feedback on each subscription row that is processed to aid debugging and help you assess the success of the operation. This may take a long time to process.

The transformed data is written out to <StoreName>SQL.txt on the current user's desktop after the script has completed. The script summarizes the number of unique user records and the total number of subscriptions processed.

Repeat this process for every store you want to migrate to SQL server.

### Step 2 Use a T-SQL stored procedure to bulk SQL import the transformed data

Each store's data must be imported one store at a time.

Copy the <StoreName>SQL.txt file created in Step 1 from the StoreFront server's desktop to C:\ on the Microsoft SQL server and rename it to SubscriptionsSQL.txt.

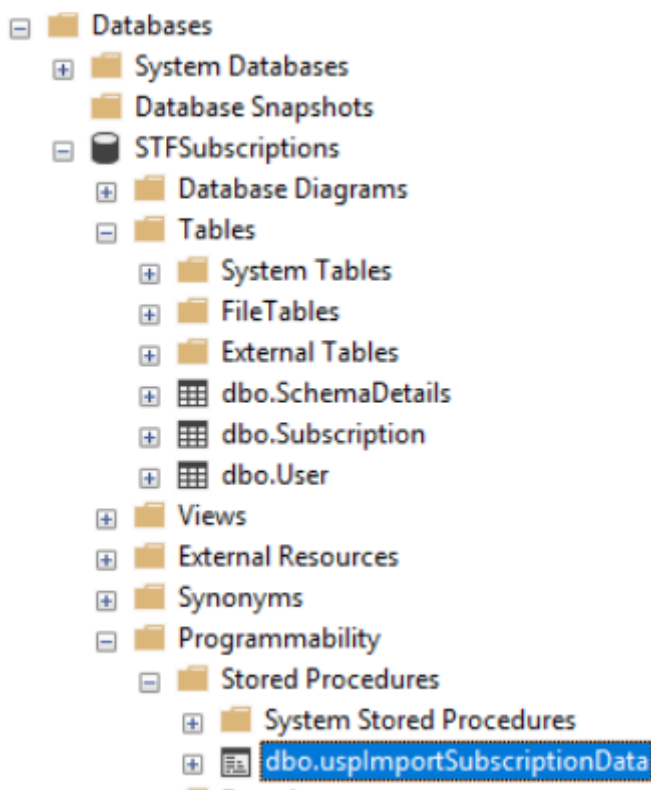

The [Create-ImportSubscriptionDataSP.sql](#) script creates a T-SQL stored procedure to bulk import the subscription data. It removes duplicate entries for each unique user so the resulting SQL data is correctly normalized and split into the correct tables.

Before executing *Create-ImportSubscriptionDataSP.sql*, change `USE [STFSubscriptions]` to match the database under which you want to create the Stored Procedure.

Open the *Create-ImportSubscriptionDataSP.sql* file using SQL Server Management Studio and execute the code within it. This script adds the *ImportSubscriptionDataSP* Stored Procedure to the database you created earlier.

After successful creation of the Stored Procedure the following message is shown in the SQL console, and the *ImportSubscriptionDataSP* Stored Procedure is added to the database:

Commands completed successfully.

Execute the Stored Procedure by right clicking it, then select **Execute Stored Procedure**, and click **OK**.

The screenshot shows a SQL Server query window with the following code:

```

1 USE [STFSubscriptions]
2 GO
3
4 DECLARE @return_value int
5 EXEC @return_value = [dbo].[uspImportSubscriptionData]
6 SELECT 'Return Value' = @return_value
7
8 GO

```

Below the query window, the Results pane shows a single row with the value 0 under the column header 'Return Value'.

	Return Value
1	0

Return value 0 indicates all data imported successfully. Any problems on import are logged to the SQL console. After the stored procedure has run successfully, compare the total number of subscription records and unique users that [Transform-SubscriptionDataForStore.ps1](#) provides with the result of the two SQL queries below. The two totals should match.

The total number of subscriptions from the transformation script should match the total number reported from SQL by

```

1 SELECT COUNT(*) AS TotalSubscriptions
2 FROM [Subscription]
3 <!--NeedCopy-->

```

The number of unique uses from the transformation script should match the number of records in the User table reported from SQL by

```

1 SELECT COUNT(*) AS TotalUsers
2 FROM [User]
3 <!--NeedCopy-->

```

If the transformation script shows 100 unique users and 1000 total subscription records, then SQL should show the same two numbers after successful migration.

Log in to StoreFront to check whether existing users can see their subscription data. Existing subscription records are updated in SQL when users subscribe or unsubscribe their resources. New users and subscription records are also created in SQL.

### Step 3 Run T-SQL queries on your imported data

**Note:**

All Delivery Controller names are case sensitive and must exactly match the case and name used within StoreFront.

```
1 -- Get all SQL subscription records
2 Use [STFSubscriptions]
3 SELECT * FROM [Subscription]
4 SELECT * FROM [User]
5 <!--NeedCopy-->
```

```
1 -- Get all subscription records for a particular user SID
2 Use [STFSubscriptions]
3 SELECT * FROM [Subscription]
4 INNER JOIN [User]
5 ON [Subscription].[user_id] = [User].[id]
6 WHERE [User].[username] = 'S-1-5-21-xxxxxxxxxx-xxxxxxxxxx-xxxxxxxxxx-
   xxxx'
7
8 -- Get total number of Subscription records for a particular user SID
9 Use [STFSubscriptions]
10 SELECT COUNT(Subscription.id)
11 FROM [Subscription]
12 INNER JOIN [User]
13 ON [Subscription].[user_id] = [User].[id]
14 WHERE [User].[username] = 'S-1-5-21-xxxxxxxxxx-xxxxxxxxxx-xxxxxxxxxx-
   xxxx'
15 <!--NeedCopy-->
```

```
1 -- Get all subscription records for a particular delivery controller
2 Use [STFSubscriptions]
3 SELECT * FROM [Subscription]
4 WHERE [resource_id] LIKE 'DeliveryController.%'
5
6 -- OR for aggregated resources use the name of the aggregation group
7 Use [STFSubscriptions]
8 SELECT * FROM [Subscription]
9 WHERE [resource_id] LIKE 'DefaultAggregationGroup.%'
10
11 -- Get all subscription records for a particular application
12 Use [STFSubscriptions]
13 SELECT * FROM [Subscription]
14 WHERE [resource_id] = ' DeliveryController.Application'
15 <!--NeedCopy-->
```

## Update or delete existing subscription records using T-SQL

### DISCLAIMER:

All example SQL update and delete statements are used entirely at your own risk. Citrix is not responsible for any loss or accidental alteration of your subscription data by incorrect use of the provided examples. The following T-SQL statements are provided as a guide to enable simple updates to be performed. Back up all subscription data in SQL database full backups before attempting to update your subscriptions or remove obsolete records. Failure to perform the necessary backups may result in data loss or corruption. Before executing your own T-SQL UPDATE or DELETE statements against the production database, test them on dummy data or on a redundant copy of the production data away from the live production database.

### Note:

All Delivery Controller names are case sensitive and must exactly match the case and name used within StoreFront.

```

1  -- Update the delivery controller used in all subscriptions.
2  Use [STFSubscriptions]
3  UPDATE [Subscription]
4  SET [resource_id] = REPLACE(resource_id,'OldDeliveryController.','
      NewDeliveryController.')
5  WHERE [resource_id] LIKE 'OldDeliveryController.%'
6
7  -- OR for aggregated resources use the name of the aggregation group
8  Use [STFSubscriptions]
9  UPDATE [Subscription]
10 SET [resource_id] = REPLACE(resource_id,'OldDeliveryController.','
      DefaultAggregationGroup.')
11 WHERE [resource_id] LIKE 'OldDeliveryController.%'
12 <!--NeedCopy-->

```

```

1  -- Delete all subscription records for a particular Delivery Controller
2  Use [STFSubscriptions]
3  DELETE FROM [Subscription]
4  WHERE [resource_id] LIKE 'DeliveryController.%'
5
6  -- OR for aggregated resources use the name of the aggregation group
7  Use [STFSubscriptions]
8  DELETE FROM [Subscription]
9  FROM [Subscription]
10 WHERE [resource_id] LIKE 'DefaultAggregationGroup.%'
11
12 -- Delete all subscription records for a particular application
13 Use [STFSubscriptions]

```

```
14 DELETE FROM [Subscription]
15 FROM [Subscription]
16 WHERE [resource_id] LIKE '%.Application'
17
18 -- Delete all subscription records for an application published via a
    specific delivery controller
19 Use [STFSubscriptions]
20 DELETE FROM [Subscription]
21 FROM [Subscription]
22 WHERE [resource_id] = 'DeliveryController.Application'
23 <!--NeedCopy-->
```

```
1 -- Delete all subscription records for a particular user SID
2 Use [STFSubscriptions]
3 DELETE FROM [Subscription]
4 INNER JOIN [User]
5 ON [Subscription].[user_id] = [User].[id]
6 WHERE [User].[username] = 'S-1-5-21-xxxxxxxxxx-xxxxxxxxxx-xxxxxxxxxx-
    xxxx'
7
8 Use [STFSubscriptions]
9 DELETE FROM [User]
10 WHERE [User].[username] = 'S-1-5-21-xxxxxxxxxx-xxxxxxxxxx-xxxxxxxxxx-
    xxxx'
11 <!--NeedCopy-->
```

```
1 -- Delete ALL subscription data from a particular database and reset
    the primary key clustered index to start numbering from 0.
2 -- USE WITH EXTREME CARE AND NOT ON LIVE PRODUCTION DATABASES.
3 -- Can be useful whilst debugging data import issues to start with a
    clean database.
4
5 Use [STFSubscriptions]
6 DELETE FROM [Subscription]
7 DBCC CHECKIDENT ([Subscription], RESEED, 0)
8 DELETE FROM [User]
9 DBCC CHECKIDENT ([User], RESEED, 0)
10 <!--NeedCopy-->
```

## Advanced store settings

October 15, 2018

You can configure advanced store properties by using the Advanced Settings page in the Configure Store Settings.

### Important

In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console, select a store in the center pane, and in the Action pane, select **Configure Store Settings**.
3. On the **Configure Store Settings** page, select **Advanced Settings**, select the advance option you want to configure, make the required change, and click **OK**.

### Address resolution type

Use the **Advanced Settings** task to specify the type of address to request from the server. The default is DnsPort. From the **Address resolution type** drop-down menu on **Advanced Settings**, select one of the following:

- Dns
- DnsPort
- IPV4
- IPV4Port
- Dot
- DotPort
- Uri
- NoChange

### Allow font smoothing

You can specify if you want font smoothing for HDX sessions. The default is On.

Use the **Advanced Settings** task, check the **Allow font smoothing** check box, and click **OK**.

### **Allow session reconnect**

You can specify if you want HDX sessions to be reconnected. The default is On.

Use the **Advanced Settings** task, check the **Allow session reconnect** check box, and click **OK** to enable session reconnect.

### **Allow special folder redirection**

Use the **Advanced Settings** task to enable or disable special folder redirection. With special folder redirection configured, users can map Windows special folders for the server to those on their local computers. Special folders refer to standard Windows folders, such as \Documents and \Desktop, which are always presented in the same way regardless of the operating system.

Use the **Advanced Settings** task, check or uncheck the **Allow special folder redirection** check box to enable or disable special folder redirection, and click **OK**.

### **Background health check polling period**

StoreFront runs periodic health checks on each XenDesktop broker and XenApp server to reduce the impact of intermittent server availability. The default is every minute (00:01:00). Use the **Advanced Settings** task, specify a time for the **Background health-check Polling period**, and click **OK** to control the frequency of the health check.

### **Communication time-out duration**

By default, requests from StoreFront to a server providing resources for a store time out after 30 seconds. The server is considered unavailable after 1 unsuccessful communication attempt. Use the **Advanced Settings** task, make your changes to the default time, and click **OK** to change these settings.

### **Connection timeout**

You can specify the number of seconds to wait when establishing an initial connection with a Delivery Controller. The default is 6.

Use the **Advanced Settings** task, specify the seconds to wait when establishing the initial connection, and click **OK**.

### **Enable enhanced enumeration**

You can enable (or disable) parallel communication with Delivery Controllers. The default is On.

Use the **Advanced Settings** task, check (or uncheck) the **Enable enhanced enumeration** check box, and click **OK**.

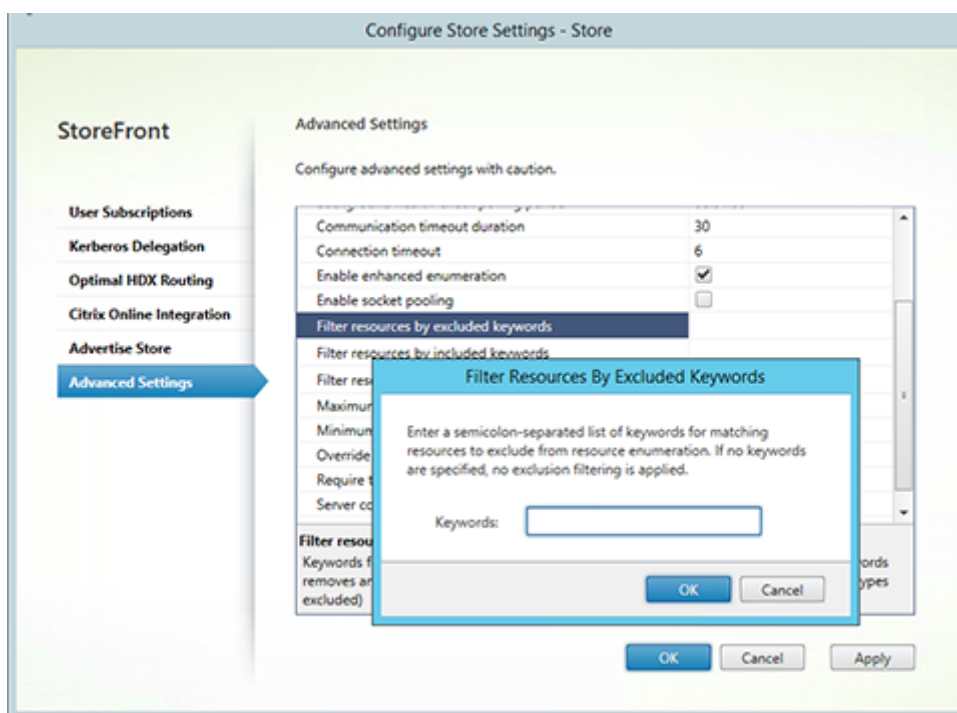

### Enable socket pooling

Socket pooling is disabled by default in stores. When socket pooling is enabled, StoreFront maintains a pool of sockets, rather than creating a socket each time one is needed and returning it to the operating system when the connection is closed. Enabling socket pooling enhances performance, particularly for Secure Sockets Layer (SSL) connections. To enable socket pooling, you edit the store configuration file. Use the **Advanced Settings** task, check the **Enable socket pooling** check box, and click **OK** to enable socket pooling.

### Filter resources by excluded keywords

You can filter matching resources by excluded keywords. Specifying exclusion keywords removes any previously configured inclusion keywords. The default is No filtering (no resource types excluded).

Use the **Advanced Settings** task, select **Filter resources by excluded keywords**, click to the right of it, enter a semicolon-separated list of keywords in the enter keywords box, and click **OK**.

### Filter resources by included keywords

You can filter matching resources by inclusion keywords. Specifying inclusion keywords removes any previously configured exclusion keywords. The default is No filtering (no resource types excluded).

Use the **Advanced Settings** task, select **Filter resources by included keywords**, click to the right of it, enter a semicolon-separated list of keywords in the enter keywords box, and click **OK**.

### **Filter resources by type**

Choose the resource types to be included in resource enumeration. The default is No filtering (all resource types included).

Use the **Advanced Settings** task, select **Filter resources by type**, click to the right of it, choose the resource types to include in the enumeration, and click **OK**.

### **Maximum concurrent enumerations**

Specify the maximum number of concurrent requests to send to different Delivery Controllers. The default is 0 (No Limit).

Use the **Advanced Settings** task, select **Maximum concurrent enumerations**, enter a number, and click **OK**.

### **Minimum farms for concurrent enumeration**

Specify the minimum number of Delivery Controllers before enumerations occur in parallel. The default is 3.

Use the **Advanced Settings** task, select **Minimum farms for concurrent enumerations**, enter a number, and click **OK**.

### **Override ICA client name**

Overrides the client name setting in the .ica launch file with an ID generated by Citrix Receiver for Web. When disabled, Citrix Receiver specifies the client name. The default is Off.

Use the **Advanced Settings** task, check the **Override the ICA client name** check box, and click **OK**.

### **Require token consistency**

When enabled, StoreFront enforces consistency between the gateway used to authenticate and the gateway used to access the store. When the values are inconsistent, users must reauthenticate. You must enable this for Smart Access. The default is On.

Use the **Advanced Settings** task, check the **Require token consistency** check box, and click **OK**.

### Server communication attempts

Specify the number of attempts to communicate with Delivery Controllers before marking them unavailable. The default is 1.

Use the **Advanced Settings** task, select **Server communication attempts**, enter a number, and click **OK**.

### Show Desktop Viewer for legacy clients

Specify whether to show the Citrix Desktop Viewer window and toolbar when users access their desktop from legacy clients. The default is Off.

Use the **Advanced Settings** task, check the **Show Desktop Viewer for legacy clients** check box, and click **OK**.

## Manage a Citrix Receiver for Web site

October 15, 2018

Citrix Receiver for Web allows access to applications, data, and desktops easily and securely from a wide range of devices. Use StoreFront to configure Citrix Receiver for Web app selection for the Citrix Receiver for Web.

Use the StoreFront management console to do the following Citrix Receiver for Web-related tasks:

---

<a href="#">Create a Citrix Receiver for Web site</a>	Create Citrix Receiver for Web sites, which enable users to access stores through a web page.
<a href="#">Configure Citrix Receiver for Web sites</a>	Modify settings for your Receiver for Web sites.
<a href="#">Configure support for the unified Citrix Receiver experience</a>	StoreFront supports both the classic and unified user experiences. The unified experience delivers a centrally managed HTML5 user experience.
<a href="#">Create and manage featured apps</a>	Create product featured app groups for your end users that are related to or fit in a specific category.
<a href="#">Configure workspace control</a>	Workspace control lets applications follow users as they move between devices.

---

### Configure the Citrix Receiver for HTML5 use of browser tabs

Specify when users start resources from shortcuts using Citrix Receiver for HTML5, whether the desktop or application replaces the Citrix Receiver for Web site in the existing browser tab rather than appearing in a new tab.

### Configure communication time-out duration and retry attempts

By default, requests from a Citrix Receiver for Web site to the associated store time out after three minutes. The store is considered unavailable after one unsuccessful communication attempt. You can change the default settings.

---

## Create a Citrix Receiver for Web site

January 4, 2019

Use the Create Website task to add Receiver for Web sites, which enable users to access stores through a webpage.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Store node in the left pane of the Citrix StoreFront management console, select the store for which you want to create the Citrix Receiver for Web site, and in the Actions pane, click Manage Receiver for Web Sites.
3. Click **Add** to create a new Citrix Receiver for Web site. Specify the desired URL in the Website path Box and click **Next**.
4. Select the Citrix Receiver experience and click **Next**.
5. Choose an authentication method, click Create and then, once the site has been created, click Finish.

The URL for users to access the Citrix Receiver for Web site is displayed. For more information about modifying settings for Citrix Receiver for Web sites, see [Configure Citrix Receiver for Web sites](#).

By default, when a user accesses a Receiver for Web site from a computer running Windows or Mac OS X, the site attempts to determine whether Citrix Receiver is installed on the user's device. If Citrix Receiver cannot be detected, the user is prompted to download and install the appropriate Citrix Receiver for their platform from the Citrix website. For more information about modifying this behavior, see [Disable detection and deployment of Citrix Receiver](#).

The default configuration for Receiver for Web sites requires that users install a compatible version of Citrix Receiver to access their desktops and applications. However, you can enable Receiver for HTML5 on your Receiver for Web sites so that users who cannot install Citrix Receiver can still access resources. For more information, see [Configure Citrix Receiver for Web sites](#).

## Configure Citrix Receiver for Web sites

May 4, 2021

Citrix Receiver for Web sites enable users to access stores through a webpage. The tasks below enable you to modify settings for your Citrix Receiver for Web sites. Some advanced settings can only be changed by editing the site configuration files. For more information, see [Configure Citrix Receiver for Web sites using the configuration files](#).

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

### Choose authentication methods

Use the Authentication Methods task to assign authentication methods for users connecting to the Citrix Receiver for Web site. This action allows you to specify a subset of authentication methods for each Receiver for Web site.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and select the relevant store that you want to modify from the results pane.
3. In the Actions pane, click **Manage Receiver for Web Sites**, click **Configure**, and choose **Authentication Methods** to specify the access methods that you want to enable for your users.

**Note:**

† Citrix Receiver for Web site authentication methods marked † are not defined by settings in the store's authentication methods. Configure these authentication methods independently for each Citrix Receiver for Web site. The other authentication methods described here are defined by the store's authentication methods. (That is, a selection or deselection made here for the Citrix Receiver for Web site is replaced by the setting for the store described in [Create a new deployment](#).)

- Select the **User name and password** check box to enable explicit authentication. Users enter their credentials when they access their stores.
  - Select the **SAML Authentication** check box to enable integration with a SAML Identity Provider. Users authenticate to an Identity Provider and are automatically logged on when they access their stores. From the Settings drop-down menu:
    - Select **Identity Provider** to configure the trust to the Identity Provider.
    - Select **Service Provider** to configure the trust for the Service Provider. This information is required by the Identity Provider.
  - Select the **Domain pass-through†** check box to enable pass-through of Active Directory domain credentials from users' devices. Users authenticate to their domain-joined Windows computers and are automatically logged on when they access their stores. In order to use this option, pass-through authentication must be enabled when Citrix Receiver for Windows is installed on users' devices. Note that Domain pass-through for Citrix Receiver for Web is limited to Windows operating systems using Internet Explorer, Microsoft Edge, Mozilla Firefox, and Google Chrome.
  - Select the **Smart card†** check box to enable smart card authentication. Users authenticate using smart cards and PINs when they access their stores.
  - Select the **Pass-through from NetScaler Gateway** check box to enable pass-through authentication from NetScaler Gateway. Users authenticate to NetScaler Gateway and are automatically logged on when they access their stores.
4. Once the authentication method has been selected, click **OK**.

For more information about modifying settings for authentication methods, see [Configure the authentication service](#).

### Add resource shortcuts to other websites

Use the **Add Shortcuts to Websites** task to provide users with rapid access to desktops and applications from trusted websites hosted on the internal network. You generate URLs for resources available through the Citrix Receiver for Web site and embed these links on your websites. Users click on a link and are redirected to the Receiver for Web site, where they log on if they have not already done so. The Receiver for Web site automatically starts the resource. In the case of applications, users are also

subscribed to the application if they have not subscribed previously.

Before you can generate resource shortcuts, you must add the URLs of host websites to the “trusted URLs” list, using the Citrix StoreFront management console or using PowerShell. Trusted URLs are listed in the `<trustedUrls>` section of the web.config file for the Citrix Receiver for Web site. web.config is typically located in the `C:\inetpub\wwwroot\Citrix\storenameWeb\` directory, where *storename* is the name specified for the store when it was created.

By default, StoreFront warns users if they attempt to launch resource shortcuts from untrusted websites, but users can still choose to launch the resource. To stop these warnings appearing, in the Stores pane click **Manage Receiver for Web Sites**, click **Configure**, choose **Advanced Settings**, and clear the option **Prompt for untrusted shortcuts**.

### Add trusted websites using the management console

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and select the site from the results pane.
3. In the **Actions** pane, click **Manage Receiver for Web Sites**, click **Configure**, and choose **Website Shortcuts**.
4. Click **Add** to enter the URL for a website on which you plan to host shortcuts. URLs must be specified in the form `http[s]://hostname[:port]`, where hostname is the fully qualified domain name of the website host and port is the port used for communication with the host if the default port for the protocol is not available. Paths to specific pages on the website are not required. To modify a URL, select the entry in the Websites list and click Edit. Select an entry in the list and click Remove to delete the URL for a website on which you no longer want to host shortcuts to resources available through the Citrix Receiver for Web site.
5. Click Get shortcuts and then click Save when you are prompted to save your configuration changes.
6. Log on to the Citrix Receiver for Web site and copy the URLs you require to your website.

### Add trusted websites using PowerShell

You can add ‘trusted’ URLs using the **Set-STFWebReceiverApplicationShortcuts** PowerShell cmdlet described in <https://developer-docs.citrix.com/projects/storefront-powershell-sdk/en/latest/Citrix.StoreFront.SubscriptionsStore/>.

### Set session timeout

By default, user sessions on Citrix Receiver for Web sites time out after 20 minutes of inactivity. When a session times out, users can continue to use any desktops or applications that are already running but

must log on again to access Citrix Receiver for Web site functions such as subscribing to applications.

Use the Session Timeout task in the **Manage Receiver for Web Sites** to change the session timeout value.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Stores** node in the left pane and in the **Actions** pane, click **Manage Receiver for Web Sites**, click **Configure**, choose **Session Settings**. You can specify minutes and hours for **Session timeout**. The minimum value for all time intervals is 1. The maximum equates to 1 year for each time interval.

### Specify different views for applications and desktops

Use the **Application and Desktops view on Receiver for Web** task in the **Manage Receiver for Web Sites** to change the session timeout value.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane and in the **Actions** pane, click **Manage Receiver for Web Sites**, click **Configure**, and choose **Client Interface Settings**.
3. From the **Select view** and **Default view** drop-down menus, select the views you want displayed.

To enable folder view:

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane and in the **Actions** pane, click **Manage Receiver for Web Sites** and click **Configure**.
3. Select **Advanced Settings** and check **Enable folder view**.

### Stop offering provisioning files to users

By default, Citrix Receiver for Web sites offer provisioning files that enable users to configure Citrix Receiver automatically for the associated store. The provisioning files contain connection details for the store that provides the resources on the site, including details of any NetScaler Gateway deployments and beacons configured for the store.

Use the **Enable Receiver configuration** task in the **Manage Receiver for Web Sites** to change the session timeout value.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Stores** node in the left pane and in the **Actions** pane, click **Manage Receiver for Web Sites**, click **Configure**, and choose **Client Interface Settings**.
3. Select **Enable Receiver configuration**.

## Configure site behavior for users without Citrix Receiver

Use the **Deploy Citrix Receiver** task to configure the behavior of a Citrix Receiver for Web site when a Windows or Mac OS X user without Citrix Receiver installed accesses the site. By default, Citrix Receiver for Web sites automatically attempt to determine whether Citrix Receiver is installed when accessed from computers running Windows or Mac OS X.

If Citrix Receiver cannot be detected, the user is prompted to download and install the appropriate Citrix Receiver for their platform. The default download location is the Citrix website, but you can also copy the installation files to the StoreFront server and provide users with these local files instead.

For users who cannot install Citrix Receiver, you can enable Citrix Receiver for HTML5 on your Citrix Receiver for Web sites. Citrix Receiver for HTML5 enables users to access desktops and applications directly within HTML5-compatible web browsers without needing to install Citrix Receiver. Both internal network connections and connections through NetScaler Gateway are supported. However, for connections from the internal network, Citrix Receiver for HTML5 only enables access to resources provided by specific products. Additionally, specific versions of NetScaler Gateway are required to enable connections from outside the corporate network. For more information, see [Infrastructure requirements](#).

For local users on the internal network, access through Citrix Receiver for HTML5 to resources provided by XenDesktop and XenApp is disabled by default. To enable local access to desktops and applications using Citrix Receiver for HTML5, you must enable the ICA WebSockets connections policy on your XenDesktop and XenApp servers. XenDesktop and XenApp use port 8008 for Citrix Receiver for HTML5 connections. Ensure your firewalls and other network devices permit access to this port. For more information, see [WebSockets policy settings](#).

Citrix Receiver for HTML5 can only be used with Internet Explorer over HTTP connections. To use Citrix Receiver for HTML5 with Mozilla Firefox over HTTPS connections, users must type **about:config** in the Firefox address bar and set the **network.websocket.allowInsecureFromHTTPS** preference to **true**.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a site. In the **Actions** pane, click **Manage Receiver for Web Sites** and click **Configure**.
3. Choose **Deploy Citrix Receiver** and specify the response of the Citrix Receiver for Web site if Citrix Receiver cannot be detected on a user's device.
  - If you want the site to prompt the user to download and install the appropriate Citrix Receiver for their platform, select **Install locally**. Users must install Citrix Receiver to access desktops and applications through the site.
    - If you select **Allow users to download HDX engine (plug in)**, the Citrix Receiver for Web allows the user to download and install Citrix Receiver on the end user client if the Citrix Receiver is not available.

- If you select **Upgrade plug-in at logon**, the Citrix Receiver for Web upgrades the Citrix Receiver client when the user logs on. To enable this feature, ensure the Citrix Receiver files are available on the StoreFront server.
- Select a source from the drop-down menu.
- If you want the site to prompt the user to download and install Citrix Receiver but fall back to Citrix Receiver for HTML5 if Citrix Receiver cannot be installed, select **Use Receiver for HTML5 if local Receiver is unavailable**. Users without Citrix Receiver are prompted to download and install Citrix Receiver every time they log on to the site.
- If you want the site to enable access to resources through Citrix Receiver for HTML5 without prompting the user to download and install Citrix Receiver, select **Always use Receiver for HTML5**. With that option selected, users always access desktops and applications on the site through Citrix Receiver for HTML5, provided they use an HTML5-compatible browser. Users without an HTML5-compatible browser have to install the native Citrix Receiver.

### **Make Citrix Receiver installation files available on the server**

By default, when a user accesses a Citrix Receiver for Web site from a computer running Windows or Mac OS X, the site attempts to determine whether Citrix Receiver is installed on the user's device. If Citrix Receiver cannot be detected, the user is prompted to download and install the appropriate Citrix Receiver for their platform from the Citrix website.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a site. In the **Actions** pane, click **Manage Receiver for Web Sites** and click **Configure**.
3. Choose **Deploy Citrix Receiver** and **Source for Receivers**, and then browse to the installation files.

### **Run the prompt to install Citrix Receiver after logon**

Before logging on to StoreFront, Citrix Receiver for Web prompts a user to install the latest Citrix Receiver if Citrix Receiver is not already installed on the user's computer (for Internet Explorer, Firefox, and Safari users) or the first time that the user visits the site (for Chrome users). Depending on the configuration, the prompt might also display if the user's installation of Citrix Receiver can be upgraded.

You can configure Citrix Receiver for Web to display the prompt after logging on to StoreFront.

1. On the **Windows Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and select the site from the results pane.
3. In the **Actions** pane, click **Manage Receiver for Web Sites**, click **Configure**.
4. Select **Advanced Settings** and check **Prompt to install Citrix Receiver after logon**.

## Remove Citrix Receiver for Web sites

Use the **Manage Receiver for Web Sites** in the **Actions** pane to delete a Citrix Receiver for Web site. When you remove a site, users can no longer use that webpage to access the store.

## Support for the unified Citrix Receiver experience

October 15, 2018

StoreFront supports both the **classic** and **unified** user experiences. With the classic experience, each Citrix Receiver platform is responsible for delivering its own user experience. The new unified experience delivers a centrally managed HTML5 user experience to all web and native Citrix Receivers. This supports customization and featured app groups management.

Stores created using this version of StoreFront use the unified experience by default, but for upgrades Citrix retains the classic experience by default. To support the unified experience you must associate a StoreFront store with a Receiver for Web site, and that site must be configured to use the unified experience.

**Important:** The unified experience is not supported if the Receiver for Web site is added to the Restricted zone. If you must add the Receiver for Web site to the Restricted zone, configure your store to use the classic experience.

Use the StoreFront management console to do the following Citrix Receiver for Web related tasks:

- Create a Citrix Receiver for Web site.
- Change the Citrix Receiver for Web site experience.
- Select a unified Citrix Receiver for Web site to associate with the store.
- Customize the Receiver appearance.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, propagate your configuration changes to the server group so that the other servers in the deployment are updated.

### Note

If using XenApp 6.x, applications set to **Stream to client** or **Streamed if possible, otherwise accessed from a server** are not supported with the unified experience enabled.

## Create a Citrix Receiver for Web website

A Citrix Receiver for Web site is created automatically, whenever you create a store. You can also create additional Receiver for Web sites using this procedure.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click Manage Receiver for Web Sites > Add and follow the wizard.

### Change the Citrix Receiver experience

You can select if a Citrix Receiver for Web website delivers the **classic** or **unified** experience. Note that enabling the classic experience disables the advanced customizations and featured app group management.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console, select the store that you want to change in the center pane, and click **Manage Receiver for Web Sites** in the Actions pane, and then click **Configure**.
3. Select **Receiver Experience** and choose **Disable classic experience** or **Enable classic experience**.

### Select a unified Citrix Receiver for Web site to associate with the store

When a new store is created using StoreFront, a Citrix Receiver for Web site in unified mode is automatically created and associated with the store. However if you upgrade from a previous version of StoreFront, it defaults to the classic experience.

To select a Citrix Receiver for Web site to provide the unified experience for a store, you must have at least one Citrix Receiver for Web site created with the classic experience disabled.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console, select a store in the center pane, and click **Configure Unified Experience** in the **Actions** pane. Only websites that support the unified experience (classic experience disabled) can be used for setting as the default for the store. If you do not have a Citrix Receiver for Web website created, a message displays including a link to the Create a new Receiver for Web website. You can also change an existing Receiver for Web site into a Receiver for Web website. See Change the Citrix Receiver experience.
3. When you have a Citrix Receiver for Web site created, choose **Configure Unified Experience** for this store and choose the specific website.

#### Important

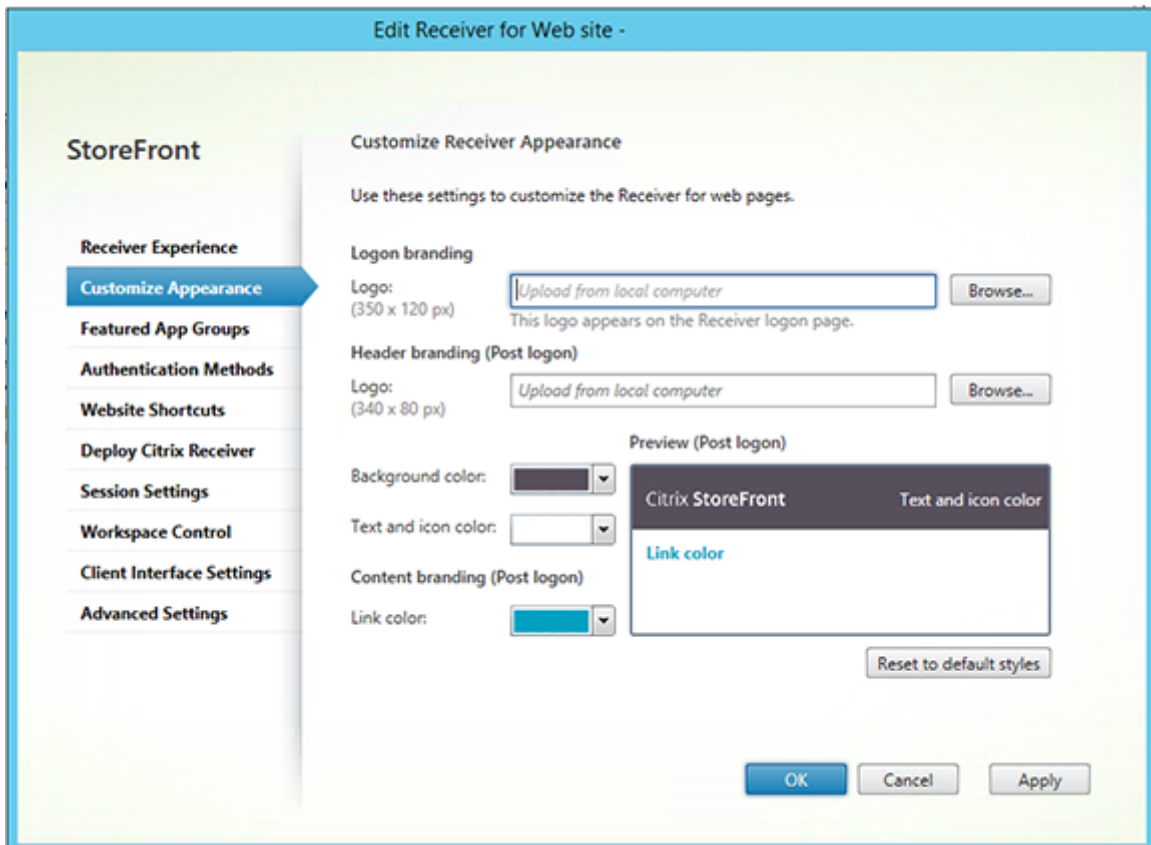

If you change the unified experience to the classic experience on a Receiver for Web site, this might affect the native Citrix Receiver clients. Changing the experience back to the unified experience on this Receiver for Web site does not update the experience to the unified experience for

the native Citrix Receiver clients. You must reset the unified experience in the Stores node on the management console.

## Customize the Citrix Receiver appearance

To customize the Citrix Receiver appearance, your Citrix Receiver for Web website must have the classic Citrix Receiver experience disabled.

1. On the Windows **Start** screen or Apps screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and in the Actions pane, click **Manage Receiver for Web Sites** and click **Configure**.
3. Select **Receiver Experience** > **Disable classic experience**.
4. Select **Customize Appearance** and make selections to customize how the website displays after logging on.

## Create and manage featured apps

October 15, 2018

You can create product featured app groups for your end users that are related to or fit in a specific category. For example, you can create a Sales Department featured app group containing applications that are used by that department. You can define featured apps in the StoreFront administration console by using application names or by using keywords or application categories that were defined in the Studio console.

Use the Featured App Groups task to add, edit, or remove featured app groups.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

Note that this functionality is available only when the Classic experience is disabled.

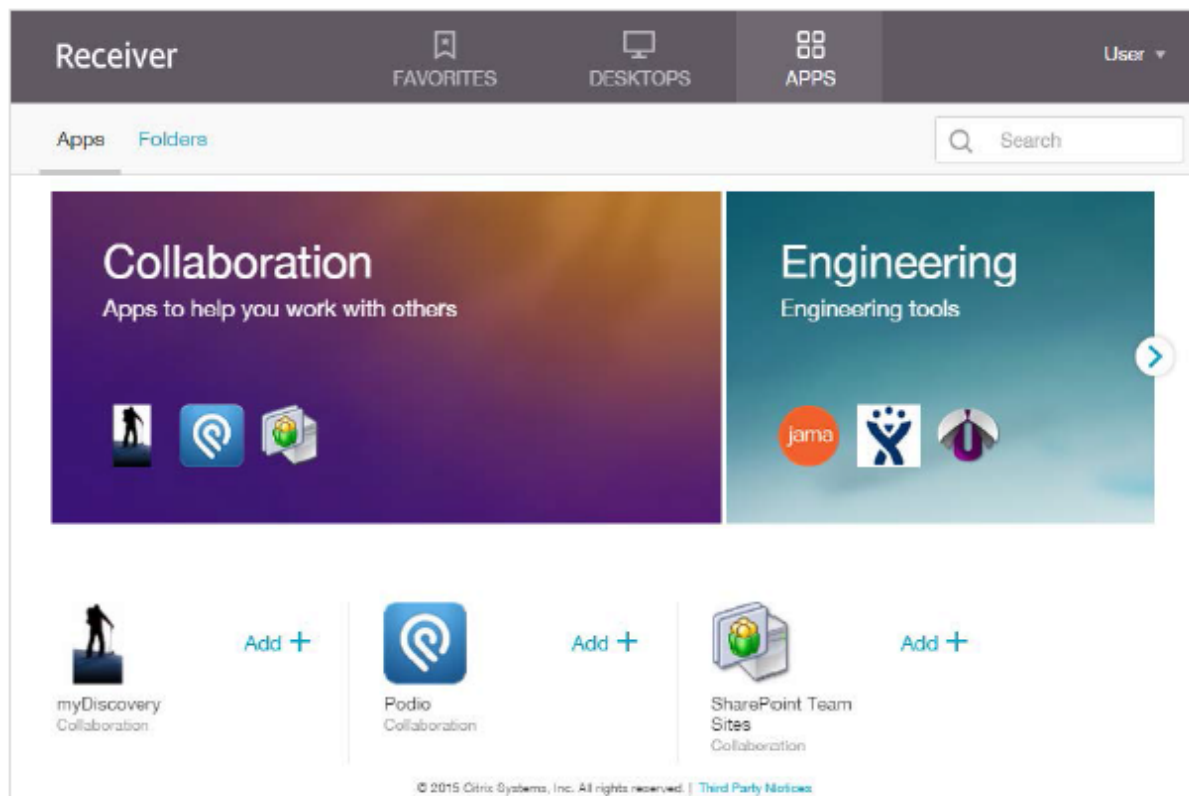

1. On the Windows **Start** screen or Apps screen, locate and click the Citrix **StoreFront** tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and in the Actions pane, click **Manage Receiver for Web Sites** and click **Configure**.
3. Select **Featured App Groups**.
4. In the **Featured App Groups** dialog box, click **Create** to define a new featured app group.
5. In the **Create Featured App Group** dialog box, specify a featured app group name, description (optional), background, and the method by which you define the featured app groups. You can choose keywords, application names, or application category, and click **OK**.

Option	Description
Keywords	Define the keywords in Studio.
Application category	Define the application category in Studio.
Application names	Use the application name to define the featured app group. All applications names matching the name included here in the Create a Featured App Group dialog screen are included in the featured app group. StoreFront does not support wildcards in application names. The match is not case sensitive, but it does match whole words. For example, if you type Excel, StoreFront matches a published app named Microsoft Excel 2013 but typing Exc does not match anything.

**Example:**

We created two featured app groups:

- Collaboration - Created by matching apps in the **Collaboration** category in Studio.
- Engineering - Created by naming the app group and specifying a collection of app names.

## Configure workspace control

October 25, 2018

Workspace control lets applications follow users as they move between devices. This enables, for example, clinicians in hospitals to move from workstation to workstation without having to restart their applications on each device. Workspace control is enabled by default for Citrix Receiver for Web sites. To disable or configure workspace control, you edit the site configuration file.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.

2. In the left pane, select **Stores** and in the Action pane, select **Manage Receiver for Web Sites**, and click **Configure**.
3. Select **Workspace Control**.
4. Configure default settings for workspace control, which include:
  - Enabling workspace control
  - Setting session reconnection options
  - Specifying log off action

## Configure Citrix Receiver for HTML5 use of browser tabs

October 15, 2018

By default, Citrix Receiver for HTML5 starts desktops and applications in a new browser tab. However, when users start resources from shortcuts using Citrix Receiver for HTML5, the desktop or application replaces the Citrix Receiver for Website in the existing browser tab rather than appearing in a new tab.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the Citrix StoreFront tile.
2. In the left pane, select **Stores** and in the Action pane, select **Manage Receiver for Web Sites**, **\*\*and click** Configure**\*\***.
3. Select **Deploy Citrix Receiver**.
4. Select **Always use HTML 5 Receiver** from the **Deployment options** drop-down menu and depending on the tab in which you want to start applications, select or deselect **Launch applications in the same tab as Receiver for Web**.

## Configure communication time-out duration and retry attempts

October 15, 2018

By default, requests from a Citrix Receiver for Web site to the associated store time out after three minutes. The store is considered unavailable after one unsuccessful communication attempt. Use the **Session Settings** task to change the default settings.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running

on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console, select a store in the center pane, and in the **Action** pane, select **Manage Receiver for Web Site**, and click **Configure**.
3. Select **Session Settings**, make your changes, and click **OK/Apply** to save the changes.

## Configure user access

January 4, 2019

### Important

In multiple server deployments, use only one server at a time to change the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

## Configure support for connections through XenApp Services URLs

Use the **Configure XenApp Services Support** task to configure access to your stores through XenApp Services URLs. Users of domain-joined desktop appliances and repurposed PCs running the Citrix Desktop Lock, along with users who have older Citrix clients that cannot be upgraded, can access stores directly using the XenApp Services URL for the store. When you create a new store, the XenApp Services URL is enabled by default.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Configure XenApp Services Support**.
3. Select or clear the **Enable XenApp Services Support** check box to, respectively, enable or disable user access to the store through the displayed XenApp Services URL.

The XenApp Services URL for a store has the form `http[s]://serveraddress/Citrix/storename/PNAgent/config.xml` where *serveraddress* is the fully qualified domain name of the server or load balancing environ-

ment for your StoreFront deployment and *storename* is the name specified for the store when it was created.

4. If you enable XenApp Services Support, optionally specify a default store in your StoreFront deployment for users with the Citrix Online Plug-in.

Specify a default store so that your users can configure the Citrix Online Plug-in with the server URL or load-balanced URL of the StoreFront deployment, rather than the XenApp Services URL for a particular store.

### Disable or enable workspace control reconnect for all Citrix Receivers

Workspace control enables applications to follow users as they move between devices. This allows, for example, clinicians in hospitals to move from workstation to workstation without having to restart their applications on each device.

StoreFront contains a configuration to disable workspace control reconnect in the Store Service for all Citrix Receivers. Manage this feature by using the StoreFront console or PowerShell.

#### Use the StoreFront management console

1. On the Windows **Start** screen or Apps screen, locate and click the Citrix **StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the **Actions** pane, click **Configure Store Settings**.
3. Select **Advanced Settings** and check or uncheck **Allow session reconnect**.

#### Use PowerShell

Make sure that you close the Administration Console. Run the following code snippet to import the StoreFront PowerShell modules:

```
1 $dsInstallProp = Get-ItemProperty `
2 \-Path HKLM:\\SOFTWARE\\Citrix\\DeliveryServicesManagement -Name
   InstallDir
3 $dsInstallDir = $dsInstallProp.InstallDir
4 & $dsInstallDir\\..\\Scripts\\ImportModules.ps1
5 <!--NeedCopy-->
```

Then the PowerShell command **Set-DSAllowSessionReconnect** turns Workspace control reconnect on or off.

#### Syntax

```
1 Set-DSAllowSessionReconnect \\[[-SiteId\] \<Int64\>\] \\[[-VirtualPath
   \] \<String\> \] \
2 \\[[-IsAllowed\] \<Boolean\>\]
3 <!--NeedCopy-->
```

For example, to turn off workspace control reconnect for a store in /Citrix/Store, the following command configures the store:

```
1 Set-DSAllowSessionReconnect -SiteId 1 -VirtualPath /Citrix/Store \` -  
   IsAllowed $false  
2 <!--NeedCopy-->
```

## Configure user subscriptions

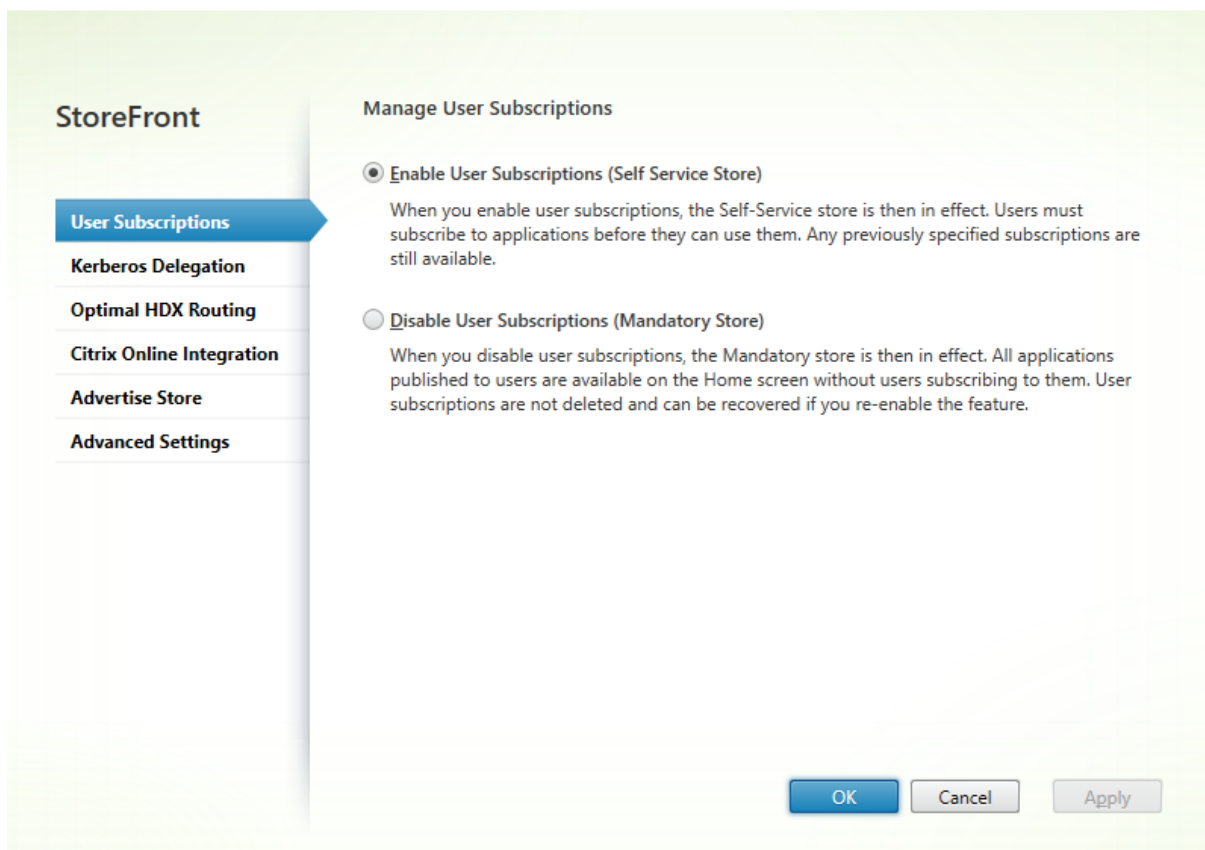

Use the User Subscriptions task to do select one of the following options:

- Require users to subscribe to applications before using them (Self Service Store).
- Enable users to receive all applications when they connect to the store (Mandatory Store).

Disabling user subscriptions for a store within StoreFront also prevents the display of the Favorites tab to users in Citrix Receiver. Disabling subscriptions does not delete the Store subscription data. Re-enabling subscriptions for the store will allow the user to see their subscribed apps in Favorites whenever they next log on.

1. On the Windows **Start** screen or **Apps** screen, locate and click the\*\* Citrix StoreFront\*\* tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Configure Store Settings > User Subscriptions** to toggle the user subscriptions feature off or on.
3. Choose **Enable user subscriptions (Self Service Store)** to make users subscribe to the applications to use them. Any previously specified subscriptions are still available.
4. Choose **Disable user subscriptions (Mandatory Store)** to make all applications published to the users available on the Home screen without users subscribing to them. Their subscriptions are not deleted and they can recover them if you re-enable the feature.

Configure Store Settings - Store

In StoreFront 3.5 or later, you can use the following PowerShell script to configure user subscriptions for a store:

```
$StoreObject = Get-STFStoreService -SiteID 1 -VirtualPath "/citrix/<yourstore>"
```

```
Set-STFStoreService -StoreService $StoreObject -LockedDown $True -Confirm:$False
```

For more information on Get-STFStoreService, see <https://developer-docs.citrix.com/projects/storefront-powershell-sdk/en/latest/Get-STFStoreService/>

## Manage subscription data for a store

Manage subscription data for a store using PowerShell cmdlets.

### Note

Use either the StoreFront management console or PowerShell to manage StoreFront. Do not use both methods at the same time. Always close the StoreFront management console before using PowerShell to change your StoreFront configuration. Citrix also recommends that you take a backup of your existing subscription data before making changes so that rollback to a previous state is possible.

### Purge subscription data

A folder and datastore containing subscription data exists for each store in your deployment.

1. Stop the Citrix Subscriptions Store service on the StoreFront server. If the Citrix Subscriptions Store service is running, it is not possible to delete subscription data for any of your stores.
2. Locate the subscription store folder on the StoreFront server: C:\Windows\ServiceProfiles\NetworkService\AppData\Roaming\Citrix\SubscriptionsStore\1\_\_Citrix\_<StoreName>
3. Delete the contents of the subscription store folder, but do not delete the folder itself.
4. Restart the Citrix Subscriptions Store service on the StoreFront server.

In StoreFront 3.5 or later, you can use the following PowerShell script to purge subscription data for a store. Run this PowerShell function as an administrator with rights to stop or start services and delete files. This PowerShell function achieves the same result as the manual steps described above.

To run the cmdlets successfully, the Citrix Subscriptions Store service must be running on the server.

```
1 function Remove-SubscriptionData
2
3 {
4
5
6     [CmdletBinding()]
7
8     [Parameter(Mandatory=$False)][String]$Store = "Store"
9
10    $SubsService = "Citrix Subscriptions Store"
11
12    # Path to Subscription Data in StoreFront version 2.6 or higher
13
14    $SubsPath = "C:\Windows\ServiceProfiles\NetworkService\AppData\
15                Roaming\Citrix\SubscriptionsStore\1__Citrix_<StoreName>\*"
16
17    Stop-Service -displayname $SubsService
18
19    Remove-Item $SubsPath -Force -Verbose
20
21    Start-Service -displayname $SubsService
22
23    Get-Service -displayname $SubsService
24 }
25
26
27 Remove-SubscriptionData -Store "YourStore"
```

### Export subscription data

You can obtain a backup of the Store subscription data in the form of a tab separated .txt file using the following PowerShell cmdlet.

```
1 $StoreObject = Get-STFStoreService -SiteID 1 -VirtualPath "/citrix/<
  yourstore>"
2
3 Export-STFStoreSubscriptions -StoreService $StoreObject -FilePath "$env
  :USERPROFILE\Desktop\Subscriptions.txt"
```

If you are managing a multiple-server deployment, you can run this PowerShell cmdlet on any server within the StoreFront server group. Each server in the server group maintains an identical synced copy of the subscription data from its peers. If you believe you are experiencing issues with subscription synchronization between the Storefront servers, then export the data from all servers in the group and compare them to see differences.

### **Restore subscription data**

Use Restore-STFStoreSubscriptions to overwrite your existing subscription data. You can restore a Store's subscription data using the tab separated .txt file backup you created earlier using Export-STFStoreSubscriptions.

```
1 $StoreObject = Get-STFStoreService -SiteID 1 -VirtualPath "/citrix/<
  yourstore>"
2
3 Restore-STFStoreSubscriptions -StoreService $StoreObject -FilePath "
  $env:USERPROFILE\Desktop\Subscriptions.txt"
```

For more information on Restore-STFStoreSubscriptions, see <https://developer-docs.citrix.com/projects/storefront-powershell-sdk/en/latest/Restore-STFStoreSubscriptions/>.

### **Restoring Data on a Single StoreFront Server**

In a single server deployment, there is no need to shut down the Subscriptions Store service. There is also no need to purge the existing subscription data before restoring the subscription data.

### **Restoring Data on a StoreFront Server Group**

To restore subscription data to a server group, the following steps are required.

Example Server Group Deployment containing three StoreFront servers.

StoreFrontA

StoreFrontB

StoreFrontC

1. Back up of the existing subscription data from any of the three servers.

2. Stop the Subscriptions Store service on servers StoreFrontB and C. This action prevents the servers from sending or receiving subscription data during the update of StoreFrontA.
3. Purge the subscription data from servers StoreFrontB and C. This action prevents mismatch of the restored subscription data.
4. Restore the data on StoreFrontA using the Restore-STFStoreSubscriptions cmdlet. It is not necessary to stop the Subscriptions Store service, or to purge the subscription data on StoreFrontA (it is overwritten during the restore operation).
5. Restart the Subscriptions Store service on servers StoreFrontB and StoreFrontC. The servers can then receive a copy of the data from StoreFrontA.
6. Wait for synchronization to occur between all servers. The time required depends on the number of records that exist on StoreFrontA. If all servers are on a local network connection, synchronization normally occurs quickly. Synchronization of subscriptions across a WAN connection may take longer.
7. Export the data from StoreFrontB and C to confirm that the synchronization has completed, or view the Store Subscription counters.

### Import subscription data

Use Import-STFStoreSubscriptions when there is no subscription data for the Store. This cmdlet also allows subscription data to be transferred from one Store to another or if subscription data is imported to newly provisioned StoreFront servers.

```
1 $StoreObject = Get-STFStoreService -SiteID 1 -VirtualPath "/citrix/<
   yourstore>"
2
3 Import-STFStoreSubscriptions -StoreService $StoreObject -FilePath "$env
   :USERPROFILE\Desktop\Subscriptions.txt"
```

For more information on Import-STFStoreSubscriptions, see <https://developer-docs.citrix.com/projects/storefront-powershell-sdk/en/latest/Import-STFStoreSubscriptions/>.

### Subscription data file details

The subscription data file is a text file containing one line per user subscription. Each line is a tab-separated sequence of values:

*<user-identifier> <resource-id> <subscription-id> <subscription-status> <property-name> <property-value> <property-name> <property-value> ...*

The values are defined as follows:

- *<user-identifier>* - Required. A sequence of characters identifying the user. This identifier is the user's Windows Security Identifier.
- *<resource-id>* - Required. A sequence of characters identifying the subscribed resource.

- *<subscription-id>* - Required. A sequence of characters uniquely identifying the subscription. This value is not used (although, a value must be present in the data file).
- *<subscription-status>* - Required. The status of the subscription: subscribed or unsubscribed.
- *<property-name>* and *<property-value>* -Optional. A sequence of zero or more pairs of *<property-name>* and *<property-value>* values. These represent properties associated with the subscription by a StoreFront client (typically a Citrix Receiver). A property with multiple values that is represented by multiple name/value pairs that have the same name (for example, "... MyProp A MyProp B ..." represents the property MyProp with values A, B).

**Example:**

S-0-0-00-0000000000-0000000000-0000000000-0000 XenApp.Excel 21EC2020-3AEA-4069-A2DD-08002B30309D Subscribed dazzle:position 1

**Size of subscription data on the StoreFront server disk**

Subscription Datastore Size	
No of Records	Size MB
0	6.02
1000	7.02
10000	40.00
100000	219.00
200000	358.00
500000	784.00
800000	1213.02
1000000	1497.15
1300000	1919.15
1500000	2205.15
1700000	2487.15
2000000	2915.15

**Size of import and export .txt files**

Subscriptions Import/Export.txt	
No of Records	Size MB
0	0.00
1000	0.13
10000	1.30
100000	12.80
200000	25.60
500000	64.10
800000	102.00
1000000	128.00
1300000	166.00
1500000	192.00
1700000	218.00
2000000	256.00

### Store Subscription Counters

You can use Microsoft Windows Performance Monitor counters (Start > Run > perfmon) to show, for example, the total numbers of subscription records on the server or number of records synchronized between StoreFront server groups.

### View the Subscription Counters using PowerShell

```
1 Get-Counter -Counter "\Citrix Subscription Store(1__citrix_store)\
   Subscription Entries Count (including unpurged deleted records)"
2
3 Get-Counter -Counter "\Citrix Subscription Store Synchronization\
   Subscriptions Store Synchronizing"
4
5 Get-Counter -Counter "\Citrix Subscription Store Synchronization\Number
   Subscriptions Synchronized"
6
7 Get-Counter -Counter "\Citrix Subscription Store Synchronization\Number
   Subscriptions Transferred"
8
9 <!--NeedCopy-->
```

## Set up highly available multi-site stores

February 25, 2021

For stores that aggregate resources from multiple deployments, particularly geographically dispersed

deployments, you can configure load balancing and failover between deployments, mapping of users to deployments, and specific disaster recovery deployments to provide highly available resources. Where you have configured separate NetScaler Gateway appliances for your deployments, you can define the optimal appliance for users to access each of the deployments.

Since StoreFront 3.5, the StoreFront management console has supported common multi-site scenarios. Citrix recommends you use the management console when it meets your requirements.

## Configure user mapping and aggregation

The StoreFront management console enables you to:

- **Map users to deployments:** Based on Active Directory group membership, you can limit which users have access to particular deployments.
- **Aggregate deployments:** You can specify which deployments have resources that you want to aggregate. Matching resources from aggregated deployments are presented to the user as a single highly-available resource.
- **Associate a zone with a deployment:** When accessed with NetScaler Gateway in a global load-balancing configuration, StoreFront prioritizes deployments from zones matching the gateway zone when launching resources.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Ensure that you have configured the store with details of all the XenDesktop and XenApp deployments that you want to use in your configuration. For more information about adding deployments to stores, see [Manage the resources made available in stores](#).
2. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
3. Select the **Stores** node in the left pane of the Citrix StoreFront management console and click **Manage Delivery Controllers** in the **Actions** pane.
4. If two or more controllers are defined, click **User Mapping and Multi-Site Aggregation Configuration > Configure**.
5. Click **Map users to controllers** and make selections on the screens to specify which Delivery Controllers are available to which users.
6. Click **Aggregate resources**, choose controllers, and click **Aggregate** to specify whether or not Delivery Controllers are aggregated. If you enable aggregation of Delivery Controllers, applications and desktops from those Delivery Controllers with the same display name and path are presented as a single application/desktop in Citrix Receiver.

7. Choose one, or both, of the **Aggregated Controller Settings** check boxes and click **OK**.

**Controllers publish identical resources** - When checked, StoreFront enumerates resources from only one of the controllers in the aggregated set. When unchecked, StoreFront enumerates resources from all controllers in the aggregated set (to accumulate the user's entire set of available resources). Checking this option gives a performance improvement when enumerating resources, but we do not recommend it unless you are certain that the list of resources is identical across all aggregated deployments.

**Load balance resources across controllers** - When checked, launches are distributed evenly among the available controllers. When unchecked, launches are directed to the first controller specified in the user mapping dialog screen, failing over to subsequent controllers if the launch fails.

## Advanced configurations

Although you can configure many common multi-site and high availability operations with the StoreFront management console, you can still configure StoreFront using the configuration files in the same manner as earlier StoreFront versions.

Extra functionality available using PowerShell or by editing the StoreFront configuration files:

- The ability to specify multiple groupings of deployments for aggregation.
  - The management console allows only a single grouping of deployments, which is sufficient for most cases.
  - For stores with many deployments with disjointed sets of resources, multiple groupings might give performance improvements.
- The ability to specify complex preference orders for aggregated deployments. The management console allows aggregated deployments to be load balanced or to be used as a single failover list.
- The ability to define disaster recovery deployments (deployments accessed only when all other deployments are unavailable).

**Warning:** After configuring advanced multi-site options by manually editing the configuration file, some tasks become unavailable in the Citrix StoreFront management console to prevent misconfiguration.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Ensure that you have configured the store with details of all the XenDesktop and XenApp deployments that you want to use in your configuration, including disaster recovery deployments. For

more information about adding deployments to stores, see [Manage the resources made available in stores](#).

2. Use a text editor to open the web.config file for the store, which is typically located in the C:\inetpub\wwwroot\Citrix\storename\ directory, where storename is the name specified for the store when it was created.
3. Locate the following section in the file.

```
<resourcesWingConfigurations>  
<resourcesWingConfiguration name="Default" wingName="Default" />  
</resourcesWingConfigurations>
```

4. Specify your configuration as shown below.

```
<resourcesWingConfigurations>  
<resourcesWingConfiguration name="Default" wingName="Default">  
<userFarmMappings>  
<clear />  
<userFarmMapping name="user_mapping">  
<groups>  
<group name="domain\usergroup" sid="securityidentifier" />  
<group ... />  
...  
</groups>  
<equivalentFarmSets>  
<equivalentFarmSet name="setname" loadBalanceMode="{LoadBalanced | Failover}"  
aggregationGroup="aggregationgroupname">  
<primaryFarmRefs>  
<farm name="primaryfarmname" />  
<farm ... />  
...  
</primaryFarmRefs>  
<backupFarmRefs>  
<farm name="backupfarmname" />  
<farm ... />  
...  
</backupFarmRefs>  
</equivalentFarmSet>  
<equivalentFarmSet ... >  
...  
</equivalentFarmSet>  
</equivalentFarmSets>
```

```
</userFarmMapping>  
<userFarmMapping>  
...  
</userFarmMapping>  
</userFarmMappings>  
</resourcesWingConfiguration>  
</resourcesWingConfigurations>
```

Use the following elements to define your configuration.

- **userFarmMapping**

Specifies groups of deployments and defines the load balancing and failover behavior between those deployments. Identifies deployments to be used for disaster recovery. Controls user access to resources by mapping Microsoft Active Directory user groups to the specified groups of deployments.

- **groups**

Specifies the names and security identifiers (SIDs) of Active Directory user groups to which the associated mapping applies. User group names must be entered in the format *domain\usergroup*. Where more than one group is listed, the mapping is only applied to users who are members of all the specified groups. To enable access for all Active Directory user accounts, set the group name & sid to **everyone**.

- **equivalentFarmSet**

Specifies a group of equivalent deployments providing resources to be aggregated for load balancing or failover, plus an optional associated group of disaster recovery deployments.

The **loadBalanceMode** attribute determines the allocation of users to deployments. Set the value of the **loadBalanceMode** attribute to **LoadBalanced** to randomly assign users to deployments in the equivalent deployment set, evenly distributing users across all the available deployments. When the value of the **loadBalanceMode** attribute is set to **Failover**, users are connected to the first available deployment in the order in which they are listed in the configuration, minimizing the number of deployments in use at any given time. Specify names for aggregation groups to identify equivalent deployment sets providing resources to be aggregated. Resources provided by equivalent deployment sets belonging to the same aggregation group are aggregated. To specify that the deployments defined in a particular equivalent deployment set should not be aggregated with others, set the aggregation group name to the empty string "".

The **identical** attribute accepts the values **true** and **false**, and specifies whether all deployments within an equivalent deployment set provide exactly the same set of resources. When the deployments are identical, StoreFront enumerates the user's resources from just one primary deployment in the set. When the deployments provide overlapping but not identical resources, StoreFront enumerates from each deployment to obtain the full set of resources available to

a user. Load balancing (at launch time) can take place whether or not the deployments are identical. The default value for the **identical** attribute is false, although it is set to **true** when StoreFront is upgraded to avoid altering the pre-existing behavior following an upgrade.

- **primaryFarmRefs**

Specifies a set of equivalent XenDesktop or XenApp sites where some or all of the resources match. Enter the names of deployments that you have already added to the store. The names of the deployments you specify must match exactly the names you entered when you added the deployments to the store.

- **optimalGatewayForFarms**

Specifies groups of deployments and defines the optimal NetScaler Gateway appliances for users to access resources provided by these deployments. Typically, the optimal appliance for a deployment is colocated in the same geographical location as that deployment. You only need to define optimal NetScaler Gateway appliances for deployments where the appliance through which users access StoreFront is not the optimal appliance.

## Configure subscription synchronization

To configure periodic pull synchronization of users' application subscriptions from stores in different StoreFront deployments, you execute Windows PowerShell commands.

Note: The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront admin console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of PowerShell before opening the StoreFront console.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server groups](#) so that the other servers in the deployment are updated.

When establishing your subscription synchronization, note that the configured Delivery Controllers must be named identically between the synchronized Stores and that the Delivery Controller names are case sensitive. Failing to duplicate the Delivery Controller names exactly may lead to users having different subscriptions across the synchronized Stores.

1. Use an account with local administrator permissions to start Windows PowerShell and, at a command prompt, type the following commands to import the StoreFront modules.

```
1 Import-Module "installationlocation\Management\Cmdlets\UtilsModule
   .psm1"
2 Import-Module "installationlocation\Management\Cmdlets\
3   SubscriptionSyncModule.psm1"
4 <!--NeedCopy-->
```

Where `installationlocation` is the directory in which StoreFront is installed, typically `C:\Program Files\Citrix\Receiver StoreFront\`.

2. To specify the remote StoreFront deployment containing the store to be synchronized, type the following command.

```
1 Add-DSSubscriptionsRemoteSyncCluster -clusterName deploymentname
2   -clusterAddress deploymentaddress
3 <!--NeedCopy-->
```

Where `deploymentname` is a name that helps you identify the remote deployment and `deploymentaddress` is the externally accessible address of the StoreFront server or load-balanced server group for the remote deployment.

3. To specify the remote store with which to synchronize users' application subscriptions, type the following command.

```
1 Add-DSSubscriptionsRemoteSyncStore -clusterName deploymentname
2   -storeName storename
3 <!--NeedCopy-->
```

Where `deploymentname` is the name that you defined for the remote deployment in the previous step and `storename` is the name specified for both the local and remote stores when they were created. To synchronize application subscriptions between the stores, both stores must have the same name in their respective StoreFront deployments.

4. To configure synchronization to occur at a particular time every day, type the following command.

```
1 Add-DSSubscriptionsSyncSchedule -scheduleName
2   synchronizationname -startTime hh:mm
3 <!--NeedCopy-->
```

Where `synchronizationname` is a name that helps you identify the schedule you are creating. Use the `-startTime` setting to specify a time of day at which you want to synchronize subscriptions between the stores. Configure further schedules to specify additional synchronization times throughout the day.

5. Alternatively, to configure regular synchronization at a specific interval, type the following command.

```
1 Add-DSSubscriptionsSyncReoccurringSchedule -scheduleName
2   synchronizationname -startTime hh:mm:ss -repeatMinutes interval
3 <!--NeedCopy-->
```

Where `synchronizationname` is a name that helps you identify the schedule you are creating. Use the `-startTime` setting to specify the a time of day at which you want to start the reoccurring schedule. For `interval`, specify the time in minutes between each synchronization.

6. Add the Microsoft Active Directory domain machine accounts for each StoreFront server in the remote deployment to the local Windows user group `CitrixSubscriptionSyncUsers` on the current server.

This will allow the servers in the remote deployment to access the subscription store service on the local deployment once you have configured a synchronization schedule on the remote deployment. The `CitrixSubscriptionSyncUsers` group is automatically created when you import the subscription synchronization module in Step 1. For more information about modifying local user groups, see [https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2008-R2-and-2008/cc772524\(v=ws.11\)](https://docs.microsoft.com/en-us/previous-versions/windows/it-pro/windows-server-2008-R2-and-2008/cc772524(v=ws.11)).

7. If your local StoreFront deployment consists of multiple servers, use the Citrix StoreFront management console to propagate the configuration changes to the other servers in the group.

For more information about propagating changes in a multiple server StoreFront deployment, see [Configure server groups](#).

8. Repeat Steps 1 to 7 on the remote StoreFront deployment to configure a complementary subscription synchronization schedule from the remote deployment to the local deployment.

When configuring the synchronization schedules for your StoreFront deployments, ensure that the schedules do not lead to a situation where the deployments are attempting to synchronize simultaneously.

9. To start synchronizing users' application subscriptions between the stores, restart the subscription store service on both the local and remote deployments. At a Windows PowerShell command prompt on a server in each deployment, type the following command.

```
1 Restart-DSSubscriptionsStoreSubscriptionService
2 <!--NeedCopy-->
```

10. To remove an existing subscription synchronization schedule, type the following command. Then, propagate the configuration change to the other StoreFront servers in the deployment and restart the subscription store service.

```
1 Remove-DSSubscriptionsSchedule -scheduleName synchronizationname
2 <!--NeedCopy-->
```

Where `synchronizationname` is the name that you specified for the schedule when you created it.

11. To list the subscription synchronization schedules currently configured for your StoreFront deployment, type the following command.

```
1 Get-DSSubscriptionsSyncScheduleSummary
2 <!--NeedCopy-->
```

## Configure optimal HDX routing for a store

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

## The difference between a farm and a zone when defining optimal gateway mappings for a store

In StoreFront versions released before 3.5, you could map an optimal gateway only to a farm or farms. The concept of zones enables you to divide a XenApp 7.8 or XenDesktop 7.8 deployment into zones based on the data center or geographic location where the XenApp or XenDesktop controllers and published resources reside. Define zones in XenApp or XenDesktop 7.8 Studio. StoreFront now interoperates with XenApp 7.8 and XenDesktop 7.8 and any zones defined in StoreFront must exactly match the zone names defined in XenApp and XenDesktop.

This version of StoreFront also allows you to create an optimal gateway mapping for all of the delivery controllers located in the defined zone. Mapping a zone to an optimal gateway is almost identical to creating mappings using farms, with which you might already be familiar. The only difference is that zones typically represent much larger containers with many more delivery controllers. You do not need to add every delivery controller to an optimal gateway mapping. To place the controllers into the desired zone, you need only tag each delivery controller with a zone name that matches a zone already defined in XenApp or XenDesktop. You can map an optimal gateway to more than one zone, but typically you should use a single zone. A zone usually represents a data center in a geographic location. It is expected that each zone has at least one optimal NetScaler Gateway that is used for HDX connections to resources within that zone.

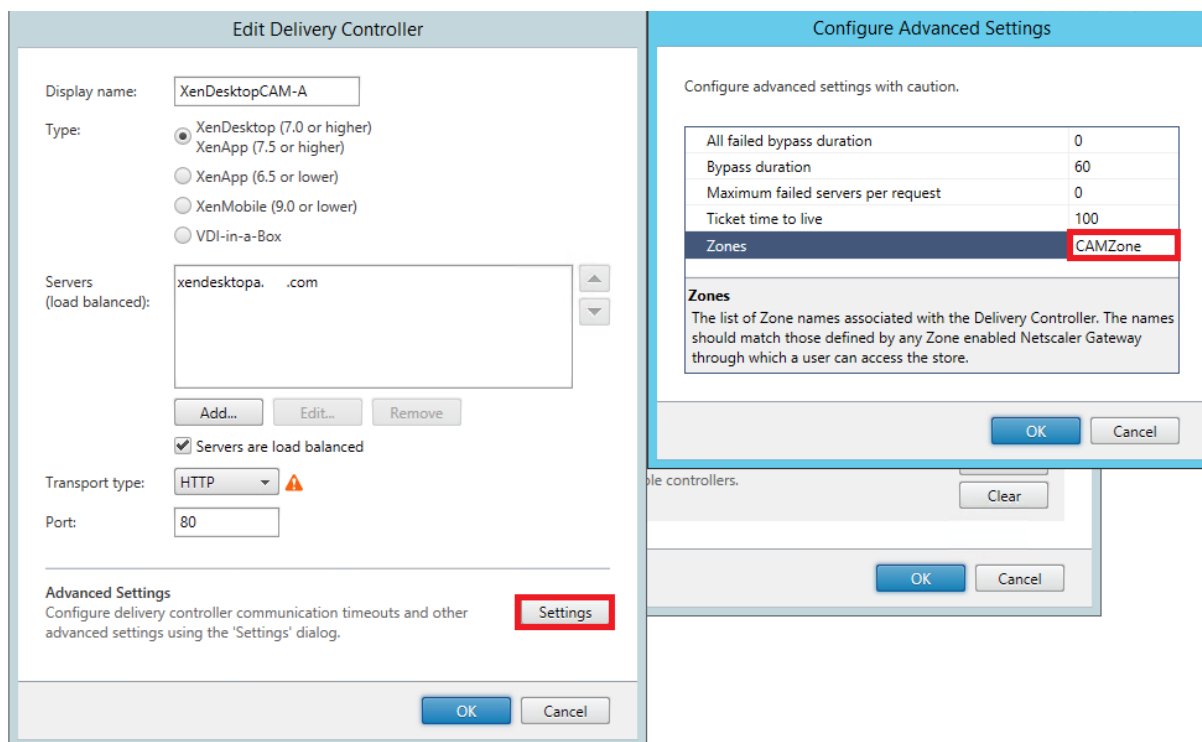

For more information about zones, see [Zones](#).

## Place a delivery controller into a zone

Set the zone attribute on every delivery controller you wish to place within a Zone.

1. On the Windows **Start** screen or Apps screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and click **Manage Delivery Controllers** in the **Actions** pane.
3. Select a controller, click **Edit**, and then click **Settings** on the **Edit Delivery Controller** screen.

4. On the **Zones** row, click in the second column.
5. Click **Add** on the **Delivery Controller Zone Names** screen and then add a zone name.

Configure optimal NetScaler Gateway routing to optimize the handling of ICA connection routing from the HDX engine to published resources such as XenDesktop VDAs or XenApp or XenDesktop published applications using StoreFront. Typically, the optimal gateway for a site is collocated in the same geographical location.

You need only define optimal NetScaler Gateway appliances for deployments where the appliance through which users access StoreFront is not the optimal gateway. If launches should be directed back through the gateway making the launch request, StoreFront does this automatically.

### Example scenario using farms

1 x UK Gateway -> 1 x UK StoreFront	-> UK Apps and Desktops local -> US Apps and Desktops used only for UK failover
-------------------------------------	--

1 x US Gateway -> 1 x US StoreFront	-> US Apps and Desktops local -> UK Apps and Desktops used only for US failover
-------------------------------------	--

A UK gateway provides remote access to UK hosted resources such as apps and desktops using a UK

## StoreFront.

The UK storefront has both a UK based and US based NetScaler Gateway defined and UK and US farms in its delivery controller list. UK users access remote resources through their geographically collocated gateway, StoreFront, and farms. If their UK resources become unavailable, they can connect to US resources as a temporary failover alternative.

Without optimal gateway routing all ICA launches would pass through the UK gateway that made the launch request regardless of where the resources are geographically located. By default, gateways used to make launch requests are identified dynamically by StoreFront when the request is made. Optimal gateway routing overrides this and forces US connections through the gateway closest to the US farms that provides apps and desktops.

**Note:** You can map only a single optimal gateway per site for each StoreFront store.

### Example scenario using zones

1 x CAMZone -> 2 x UK StoreFronts	-> Cambridge, UK: Apps and Desktops -> Fort Lauderdale, Eastern US: Apps and Desktops -> Bangalore, India: Apps and Desktops
1 x FTLZone -> 2 x US StoreFronts	-> Fort Lauderdale, Eastern US: Apps and Desktops -> Cambridge, UK: Apps and Desktops -> Bangalore, India: Apps and Desktops
1 x BGLZone -> 2 x IN StoreFronts	-> Bangalore, India: Apps and Desktops -> Cambridge, UK: Apps and Desktops -> Fort Lauderdale, Eastern US: Apps and Desktops

Figure 1. Suboptimal gateway routing

Figure 2. Optimal gateway routing

## Use the Citrix StoreFront management console

After you configure separate NetScaler Gateway appliances for your deployments, you can define the optimal appliance for users to access each of the deployments.

1. On the Windows **Start** screen or **Apps** screen, locate and click the **Citrix StoreFront** tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Configure Store Settings**.
3. On the **Settings > Optimal HDX Routing** page, select a gateway.
4. If you select the **External Only** check box, it is equivalent to **-enabledOnDirectAccess = false** and Direct HDX Connection is equivalent to using **Set-DSFarmsWithNullOptimalGateway** for farms or zones.

Configure Store Settings - Store1

**StoreFront**

- User Subscriptions
- Kerberos Delegation
- Optimal HDX Routing**
- Citrix Online Integration
- Advertise Store
- Advanced Settings

**Optimal HDX Routing**

HDX connections can be routed through gateways based on delivery controllers or XenApp/ XenDesktop zones. Typically resources should be mapped to the gateway that resides in the same geographical location or datacentre.

Optimal Gateway	External only <i>i</i>	Delivery Controllers	Zones <i>i</i>
Direct HDX connection <i>i</i>	N/A		
CAMGateway	<input checked="" type="checkbox"/>		CAMZone
FTLGateway	<input checked="" type="checkbox"/>		FTLZone
BGLGateway	<input checked="" type="checkbox"/>		BGLZone

### Add a new gateway

One of the options in the previous procedure is to **Add gateway**. After you choose **Add gateway**, the Add NetScaler Gateway screen displays.

1. On the **General Settings** screen, complete the Display name, NetScaler Gateway URL, and Usage or Role settings to configure access to stores through NetScaler Gateway for users connecting from public networks. Remote access through a NetScaler Gateway cannot be applied to unauthenticated stores.
2. On the **Secure Ticket Authority (STA)** screen, complete the options displayed. STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.
3. On the **Authentication Settings** screen, enter the settings that specify how the remote user provides authentication credentials.

## Use PowerShell to configure optimal NetScaler Gateway routing for a store

PowerShell API parameters

**-SiteId (Int)**—Site ID within IIS. This is typically 1 for the site in IIS where StoreFront is installed by default.

**-ResourcesVirtualPath (String)**—Path to the store that is to be configured to have a farm to optimal gateway mapping.

Example: `"/Citrix/Store"`

**-GatewayName (String)**—Name given to identify the Netscaler Gateway within StoreFront.

Example 1: `ExternalGateway`

Example 2: `InternalGateway`

**-Hostnames (String Array)**—Specifies the fully qualified domain name (FQDN) and port of the optimal NetScaler Gateway appliance.

Example1 for standard vServer port 443: `gateway.example.com`

Example2 for nonstandard vServer port 500: `gateway.example.com:500`

**-Farms (String Array)**—Specifies a set of (typically colocated) XenDesktop, XenApp, and App Controller deployments that share a common optimal NetScaler Gateway appliance. A farm can contain just a single delivery controller or multiple delivery controller that provides published resources.

You can configure a XenDesktop site in StoreFront under delivery controllers as “XenDesktop”. This represents a single farm. This could contain multiple delivery controllers in its failover list.

Example: `“XenDesktop”`

`XenDesktop-A.example.com`

`XenDesktop-B.example.com`

`XenDesktop-C.example.com`

**-Zones (String Array)**—Specifies a data center or data centers containing many delivery controllers. This requires you tag delivery controller objects in StoreFront with the appropriate zone to which you want to allocate them.

**-staUrls (String Array)**—Specifies the URLs for XenDesktop or XenApp servers running the Secure Ticket Authority (STA). If using multiple farms, list the STA servers on each using a comma separated list:

Example: `http://xenapp-a.example.com/scripts/ctxsta.dll,http://xendesktop-a.example.com/scripts/ctxsta.dll`

**-StasUseLoadBalancing (Boolean)**—Set to **true**: randomly obtains session tickets from all STAs, evenly distributing requests across all the STAs. Set to **false**: users are connected to the first available STA in the order in which they are listed in the configuration, minimizing the number of STAs in use at any given time.

**-StasBypassDuration**—Set the time period, in hours, minutes, and seconds, for which an STA is considered unavailable after a failed request.

Example: 02:00:00

**-EnableSessionReliability (Boolean)**—Set to **true**: keeps disconnected sessions open while Receiver attempts to reconnect automatically. If you configured multiple STAs and want to ensure that session reliability is always available, set the value of the useTwoTickets attribute to **true** to obtain session tickets from two different STAs in case one STA becomes unavailable during the session.

**-UseTwoTickets (Boolean)**—Set to **true**: obtains session tickets from two different STAs in case one STA becomes unavailable during the session. Set to **false**: uses only a single STA server.

**-EnabledOnDirectAccess (Boolean)**—Set to **true**: ensures that when local users on the internal network log on to StoreFront directly, connections to their resources are still routed through the optimal appliance defined for the farm. Set to **false**: connections to resources are not routed through the optimal appliance for the farm unless users access StoreFront through a NetScaler Gateway.

When PowerShell scripts span multiple lines such as shown below, each line must end with the back-tick character.

Citrix recommends copying any code examples into the Windows PowerShell Integrated Scripting Environment (ISE) to validate the Powershell code using the format checker before you run it.

## Configure an optimal gateway for a farm

### Note

Configuration of Optimal HDX routing with the old PowerShell cmdlet, Set-DSOptimalGatewayForFarms, does not work.

To work around this issue:

1. Configure a global gateway with the settings you want for Optimal HDX routing using the Add-DSGlobalV10Gateway command and provide default values for the authentication settings.
2. Use the Add-DSSStoreOptimalGateway command to add the optimal gateway configuration.

Example:

```
Add-DSGlobalV10Gateway -Id 2eba0524-af40-421e-9c5f-a1ccca80715f -Name LondonGateway -Address "http://example" -Logon Domain -SecureTicketAuthorityUrls @"http://staur1",
```

“http://staur12”)

```
Add-DSStoreOptimalGateway -SiteId 1 -VirtualPath /Citrix/Store1 -GatewayId 2eba0524-af40-421e-9c5f-a1ccca80715f -Farms @("Controller") -EnabledOnDirectAccess $true
```

Example:

Create or overwrite Optimal Gateway For Farms mappings for the store **Internal**.

```
1 & "$Env:PROGRAMFILES\Citrix\Receiver StoreFront\Scripts\
  ImportModules.ps1"
2
3 Set-DSOptimalGatewayForFarms -SiteId 1 `
4
5 -ResourcesVirtualPath /Citrix/Internal `
6 \-GatewayName "gateway1" `
7 \-Hostnames "gateway1.example.com:500" `
8 \-Farms "XenApp","XenDesktop" `
9 \-StaUrls "https://xenapp.example.com/scripts/ctxsta.dll","https://
  xendesktop.example.com/scripts/ctxsta.dll" `
10 \-StasUseLoadBalancing:$false `
11 \-StasBypassDuration 02:00:00 `
12 \-EnableSessionReliability:$false `
13 **--UseTwoTickets:$false `
14 \-EnabledOnDirectAccess:$true
15 <!--NeedCopy-->
```

### Configure an optimal gateway for a zone

Example:

Create or overwrite Optimal Gateway For Farms mappings for the zone “CAMZone”

```
“& "$Env:PROGRAMFILES\Citrix\Receiver StoreFront\Scripts\ImportModules.ps1”
```

```
Set-DSOptimalGatewayForFarms -SiteId 1 ‘
```

```
-ResourcesVirtualPath /Citrix/Internal ‘
```

```
-GatewayName “gateway1” ‘
```

```
-Hostnames “gateway1.example.com:500” ‘
```

```
-Zones “CAMZone” ‘
```

```
-StaUrls “https://xenapp.example.com/scripts/ctxsta.dll”,”https://xendesktop.example.com/scripts/ctxsta.dll” ‘
```

```
-StasUseLoadBalancing:$false ‘
```

```
-StasBypassDuration 02:00:00 ‘
```

```
-EnableSessionReliability:$false ‘
```

```
-UseTwoTickets:$false ‘
```

```
-EnabledOnDirectAccess:$true
```

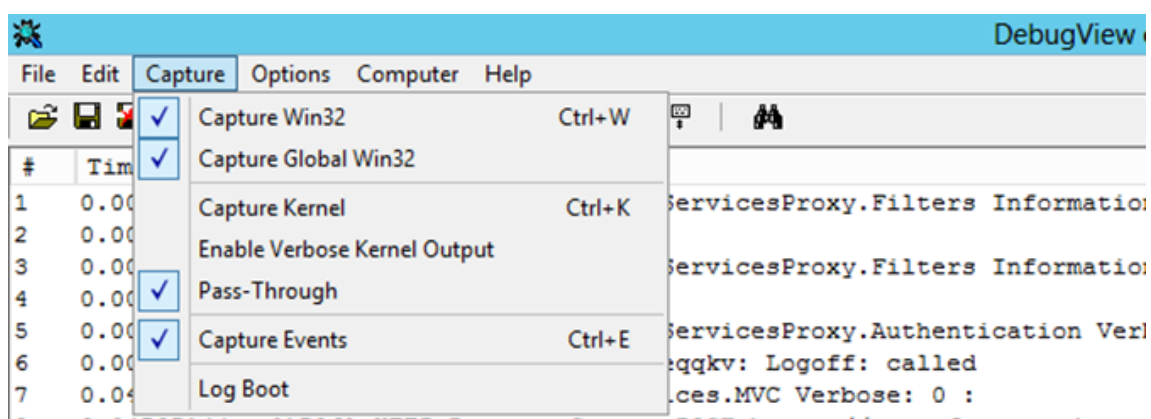

```
1 Example:
2
3 This script returns all Optimal Gateway For Farms mappings for the
  store called Internal.
4
5 **Get-DSOptimalGatewayForFarms -SiteId 1 -ResourcesVirtualPath "/
  Citrix/Internal**
6
7 Example:
8
9 Remove all optimal gateway for farms mappings for store called Internal
  .
10
11 **Remove-DSOptimalGatewayForFarms -SiteId 1 -ResourcesVirtualPath "/
  Citrix/Internal**
12
13 **Configure direct HDX connections for farms**
14
15 Example:
16
17 This script prevents all ICA launches from passing through a gateway
  for the list of specified farms for the store called Internal.
18
19 **Set-DSFarmsWithNullOptimalGateway -SiteId 1 -ResourcesVirtualPath /
  Citrix/Store -Farms "Farm1","Farm2**
20
21 Example:
22
23 This script returns all farms that are configured to prevent ICA
  launches from passing through a gateway for a store called Internal.
24
25 **Get-DSFarmsWithNullOptimalGateway -SiteId 1 -ResourcesVirtualPath "/
  Citrix/Internal**
26
27
28
29 **Determine if your Optimal Gateway For Farms mappings are being used
  by StoreFront**
30
31 1. Enable StoreFront tracing on all server group nodes using
  PowerShell by running:
32
33   ``
34   & "$Env:PROGRAMFILES\Citrix\Receiver StoreFront\Scripts\
```

```

35      ImportModules.ps1"
36      \#Traces output is to c:\Program Files\Citrix\Receiver
37      Storefront\admin\trace\
38      Set-DSTraceLevel -All -TraceLevel Verbose
39      <!--NeedCopy-->

```

1. Open the Debug View tool on the desktop of a StoreFront server. If you are using a storefront server group, you might have to do this on all nodes to ensure you obtain traces from the node that receives the launch request.
2. Enable Capture Global Win32 events.

3. Save the trace output as a .log file and open the file with Notepad. Search for the log entries shown in the example scenarios below.
4. Turn tracing off afterwards, as it consumes a lot of disk space on your StoreFront servers.

### **Set-DSTraceLevel -All -TraceLevel Off**

#### **Tested optimal gateway scenarios**

- External client logs on **Gateway1**. Launch is directed through the designated optimal gateway **Gateway2** for the farm **Farm2**.

#### **Set-DSOptimalGatewayForFarms -onDirectAccess=false**

Farm2 is configured to use the optimal gateway Gateway2.

Farm2 has optimal gateway on direct access disabled.

The optimal gateway Gateway2 will be used for the launch.

- Internal client logs on using StoreFront. Launch is directed through the designated optimal gateway Gateway1 for the farm Farm1.

#### **Set-DSOptimalGatewayForFarms -onDirectAccess=true**

No dynamically identified gateway in request. StoreFront was contacted directly.

Farm1 is configured to use the optimal gateway Gateway1.

Farm1 has optimal gateway on direct access enabled.

The optimal gateway Gateway1 will be used for the launch.

- Internal client logs on using Gateway1. Launches of resources on Farm1 are prevented from passing through any gateway and StoreFront is contacted directly.

#### **Set-DSFarmsWithNullOptimalGateway**

Dynamically identified gateway in request: Gateway1

Farm1 is configured to not use a gateway. No gateway will be used for launch.

## **Integrate with NetScaler Gateway and NetScaler**

October 15, 2018

Use NetScaler Gateway with StoreFront to provide secure remote access for users outside the corporate network and NetScaler to provide load balancing.

### **Plan gateway and server certificate usage**

Integrating StoreFront with NetScaler Gateway and NetScaler requires a plan for gateway and server certificate usage. Consider which Citrix components are going to require server certificate(s) within your deployment:

- Plan to obtain certificates for Internet-facing servers and gateways from external certificate authorities. Client devices may not automatically trust certificates signed by an internal certificate authority.
- Plan for both external and internal server names. Many organizations have separate namespaces for internal and external use - such as example.com (external) and example.net (internal). A single certificate can contain both of these kinds of name by using the Subject Alternative Name (SAN) extension. This is not normally recommended. A public certificate authority will only issue a certificate if the top-level domain (TLD) is registered with IANA. In this case, some commonly used internal server names (such as example.local) cannot be used, and separate certificates for external and internal names are required anyway.
- Use separate certificates for external and internal servers, where possible. A gateway may support multiple certificates, either by binding a different certificate to each interface.
- Avoid sharing certificates between Internet-facing and non-Internet-facing servers. These certificates are likely to be different - with different validity periods and different revocation policies than certificates issued by your internal certificate authorities.

- Share “wildcard” certificates only between equivalent services. Avoid sharing a certificate between different types of server (for example StoreFront servers, and other kinds of servers). Avoid sharing a certificate between servers which are under different administrative control, or which have different security policies. Typical examples of servers which provided equivalent service are:
  - A group of StoreFront servers and the server that performs load balancing between them.
  - A group of Internet-facing gateways within GSLB.
  - A group of XenApp and XenDesktop 7.x controllers, which provide equivalent resources.
- Plan for hardware-secured private key storage. Gateways and servers, including some NetScaler models, can store the private key securely within a hardware security module (HSM) or Trusted Platform Module (TPM). For security reasons, these configurations are not usually intended to support sharing of certificates and their private keys, Consult the documentation for the component. If implementing GSLB with NetScaler Gateway, this may require each gateway within GSLB to have an identical certificate, which contains all the FQDNs you wish to use.

For more information about securing your Citrix deployment, see the white paper [End-To-End Encryption with XenApp and XenDesktop](#) and the XenApp and XenDesktop [Secure](#) section.

## Add a NetScaler Gateway connection

October 15, 2018

Use the Add NetScaler Gateway Appliance task to add NetScaler Gateway deployments through which users can access your stores. You must enable the pass-through from NetScaler Gateway authentication method before you can configure remote access to your stores through NetScaler Gateway. For more information about configuring NetScaler Gateway for StoreFront, see [Using WebFront to Integrate with StoreFront](#).

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and in the Actions pane, click Manage NetScaler Gateways.
3. Click **Add** and General Settings, specify a name for the NetScaler Gateway deployment that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that deployment. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

4. Enter the URL of the virtual server or user logon point (for Access Gateway 5.0) for your deployment. Specify the product version used in your deployment.

The fully qualified domain name (FQDN) for your StoreFront deployment must be unique and different from the NetScaler Gateway virtual server FQDN. Using the same FQDN for StoreFront and the NetScaler Gateway virtual server is not supported.

5. If you are adding an Access Gateway 5.0 deployment, continue to Step 7. Otherwise, specify the subnet IP address of the NetScaler Gateway appliance, if necessary. A subnet IP address is required for Access Gateway 9.3 appliances, but optional for more recent product versions.

The subnet address is the IP address that NetScaler Gateway uses to represent the user device when communicating with servers on the internal network. This can also be the mapped IP address of the NetScaler Gateway appliance. Where specified, StoreFront uses the subnet IP address to verify that incoming requests originate from a trusted device.

6. If you are adding an appliance running NetScaler Gateway 10.1 - 11.0, Access Gateway 10 - 11.0, or Access Gateway 9.3, select from the Logon type list the authentication method you configured on the appliance for Citrix Receiver users.

The information you provide about the configuration of your NetScaler Gateway appliance is added to the provisioning file for the store. This enables Citrix Receiver to send the appropriate connection request when contacting the appliance for the first time.

- If users are required to enter their Microsoft Active Directory domain credentials, select Domain.
- If users are required to enter a tokencode obtained from a security token, select Security token.
- If users are required to enter both their domain credentials and a tokencode obtained from a security token, select Domain and security token.
- If users are required to enter a one-time password sent by text message, select SMS authentication.
- If users are required to present a smart card and enter a PIN, select Smart card.

If you configure smart card authentication with a secondary authentication method to which users can fall back if they experience any issues with their smart cards, select the secondary authentication method from the Smart card fallback list. Continue to Step 8.

7. To add an Access Gateway 5.0 deployment, indicate whether the user logon point is hosted on a standalone appliance or an Access Controller server that is part of a cluster. If you are adding a cluster, click Next and continue to Step 9.

8. If you are configuring StoreFront for NetScaler Gateway 10.1 - 11.0, Access Gateway 10 - 11.0, Access Gateway 9.3, or a single Access Gateway 5.0 appliance, complete the NetScaler Gateway authentication service URL in the Callback URL box. StoreFront automatically appends the standard portion of the URL. Click Next and continue to Step 11.

Enter the internally accessible URL of the appliance. StoreFront contacts the NetScaler Gateway authentication service to verify that requests received from NetScaler Gateway originate from that appliance.

9. To configure StoreFront for an Access Gateway 5.0 cluster, list on the Appliances page the IP addresses or FQDNs of the appliances in the cluster and click Next.
10. On the Enable Silent Authentication page, list URLs for the authentication service running on the Access Controller servers. Add URLs for multiple servers to enable fault tolerance, listing the servers in order of priority to set the failover sequence. Click Next.

StoreFront uses the authentication service to authenticate remote users so that they do not need to re-enter their credentials when accessing stores.

11. For all deployments, if you are making resources provided by XenDesktop or XenApp available in the store, list on the Secure Ticket Authority (STA) page URLs for servers running the STA. Add URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence.

The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

12. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the Enable session reliability check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the Request tickets from two STAs, where available check box.

When the Request tickets from two STAs, where available check box is selected, StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.

13. Click Create to add details of your NetScaler Gateway deployment. Once the deployment has been added, click Finish.

For more information about updating the details of your deployments, see [Configure NetScaler Gateway connection settings](#).

To provide access to stores through NetScaler Gateway, one internal beacon point and at least two external beacon points are required. Citrix Receiver uses beacon points to determine whether users

are connected to local or public networks and then selects the appropriate access method. By default, StoreFront uses the server URL or load-balanced URL of your deployment as the internal beacon point. The Citrix website and the virtual server or user logon point (for Access Gateway 5.0) URL of the first NetScaler Gateway deployment you add are used as external beacon points by default. For more information about changing beacon points, see [Configure beacon points](#).

To enable users to access your stores through NetScaler Gateway, ensure that you [configure remote user access](#) for those stores.

## Import a NetScaler Gateway

October 25, 2018

Remote access settings configured within the NetScaler administration console have to be identical to those configured in StoreFront. This article shows you how to import a NetScaler Gateway so that NetScaler and StoreFront are configured correctly to work together.

### Requirements

- NetScaler 11.1.51.21 or higher is required to export multiple gateway vServers to a ZIP file. **Note:** NetScaler can only export gateway vServers created using the XenApp and XenDesktop wizard.
- It must be possible for DNS to resolve, and for StoreFront to contact, all STA (Secure Ticket Authority) server URLs in the GatewayConfig.json file within the ZIP file generated by NetScaler.
- The GatewayConfig.json file within the ZIP file generated by NetScaler has to contain the URL of an existing Citrix Receiver for Web site on the StoreFront server. NetScaler 11.1 and higher takes care of this by contacting the StoreFront server and enumerating all existing stores and Citrix Receiver for Web sites before generating the ZIP file for export.
- StoreFront must be able to resolve the callback URL in DNS to the gateway VPN vServer IP address for authentication using the imported gateway to succeed.

The callback URL and port combination you use is usually the same as the gateway URL and port combination, as long as StoreFront can resolve this URL.

or

The callback URL and port combination may be different from the gateway URL and port combination if you use different external and internal DNS namespaces in your environment. If your gateway is located in a DMZ and uses a <example.com> URL and StoreFront is on your private corporate network and uses a <example.local> URL you may use a <example.local> callback URL to point back to the gateway vServer in the DMZ.

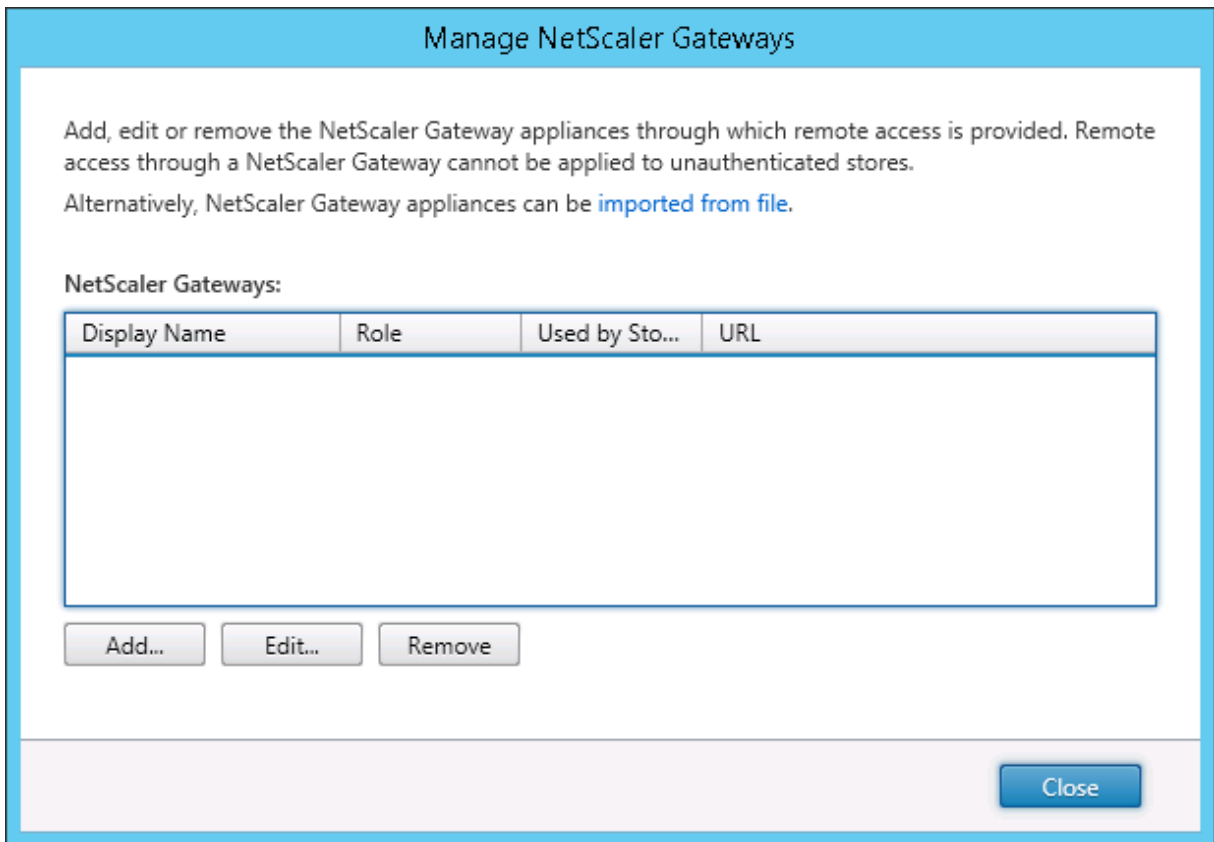

## Import a NetScaler Gateway using the console

You can import one or multiple NetScaler Gateway appliances by importing a NetScaler configuration file.

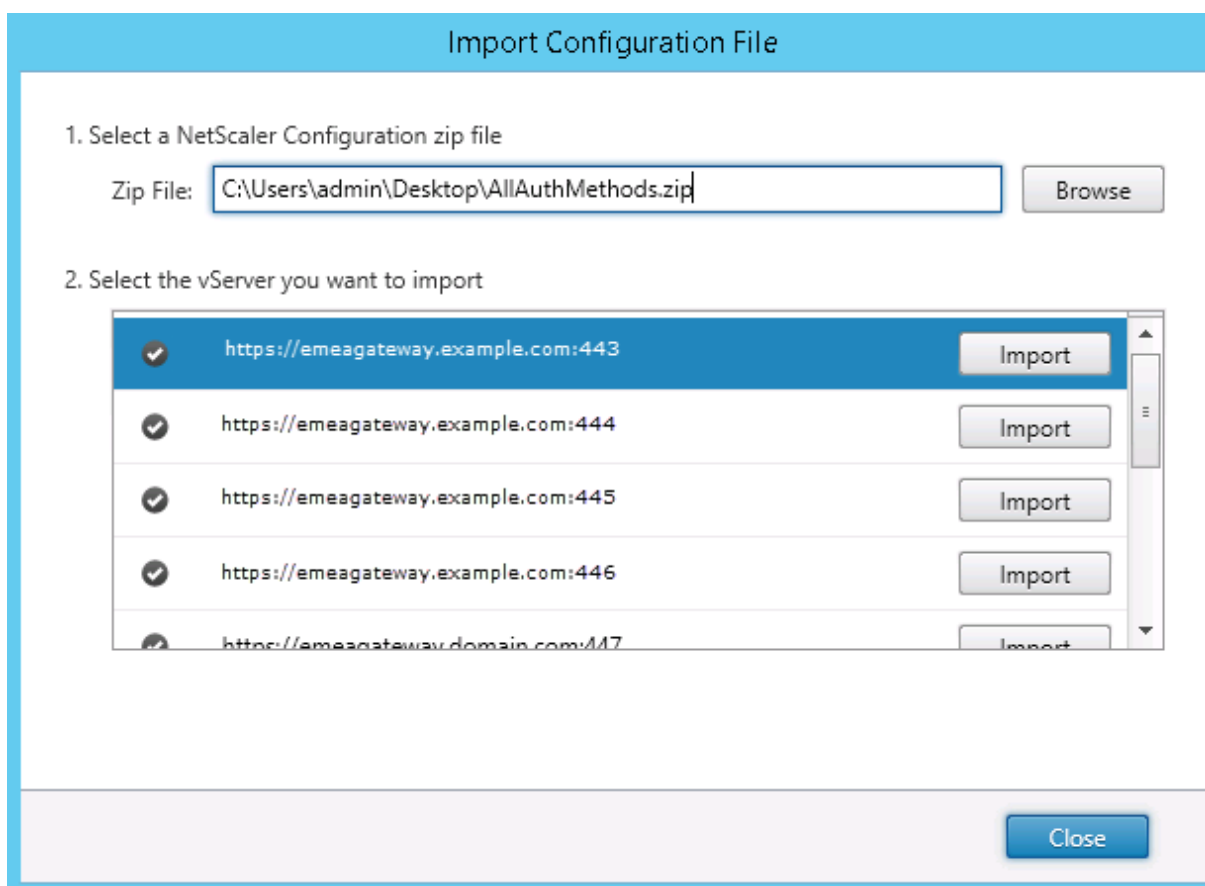

### Important

Citrix does not support manual editing of the configuration file exported from NetScaler.

1. Select **Stores** in the left pane of the Citrix StoreFront management console, and in the **Actions** pane, click **Manage NetScaler Gateways**.
2. On the Manage NetScaler Gateways screen, click the **imported from file** link.

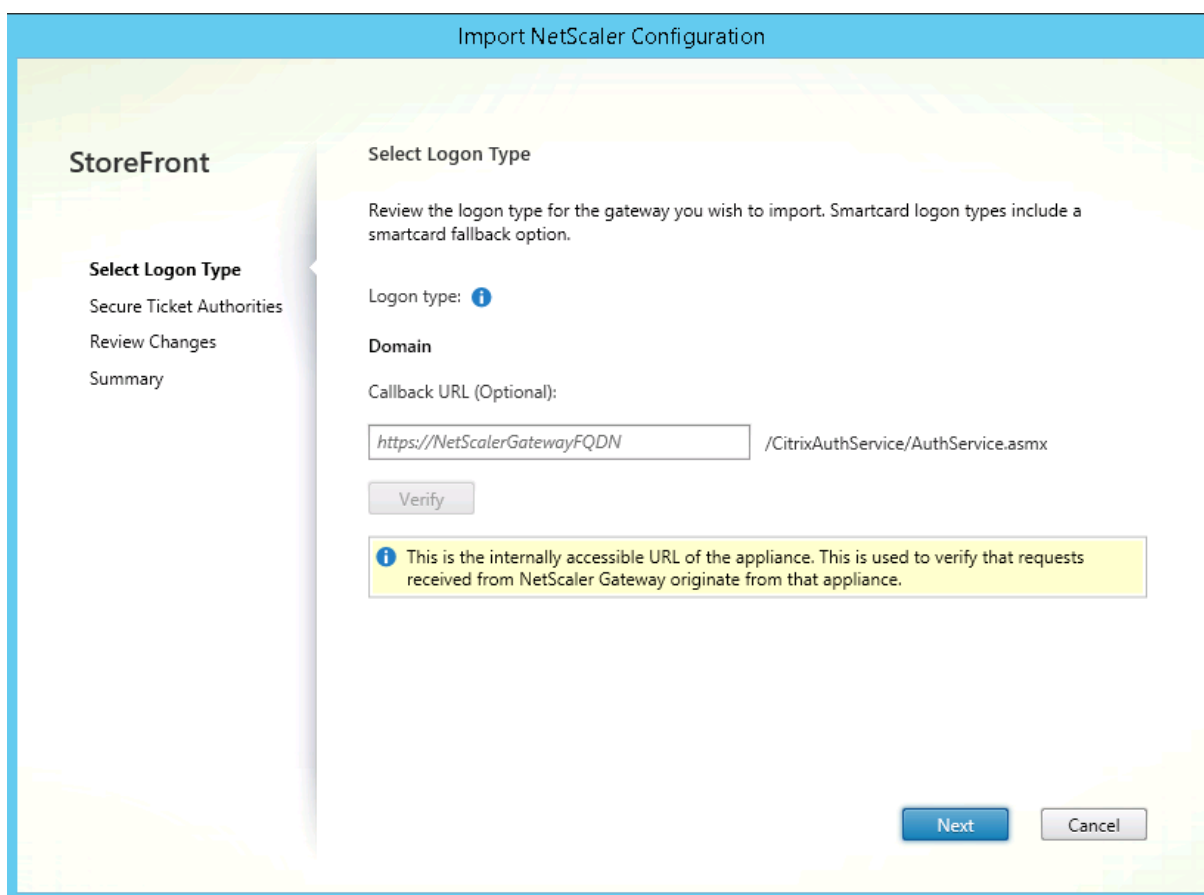

3. Browse to the NetScaler Configuration ZIP file.
4. A list of gateway vServers from the selected ZIP file is displayed. Select the gateway vServer you want to import and click **Import**. If you are repeating an import of a vServer, the Import button displays as Update. If you choose **Update**, you will have the option later to overwrite or create a new gateway.

5. Review the logon type for the selected gateway and specify a callback URL if required. The logon type is the authentication method that you configured on the NetScaler Gateway appliance for Citrix Receiver users. Some logon types require callback URLs (see table).

- Click **Verify** to check that the Callback URL is valid and reachable from the StoreFront server.

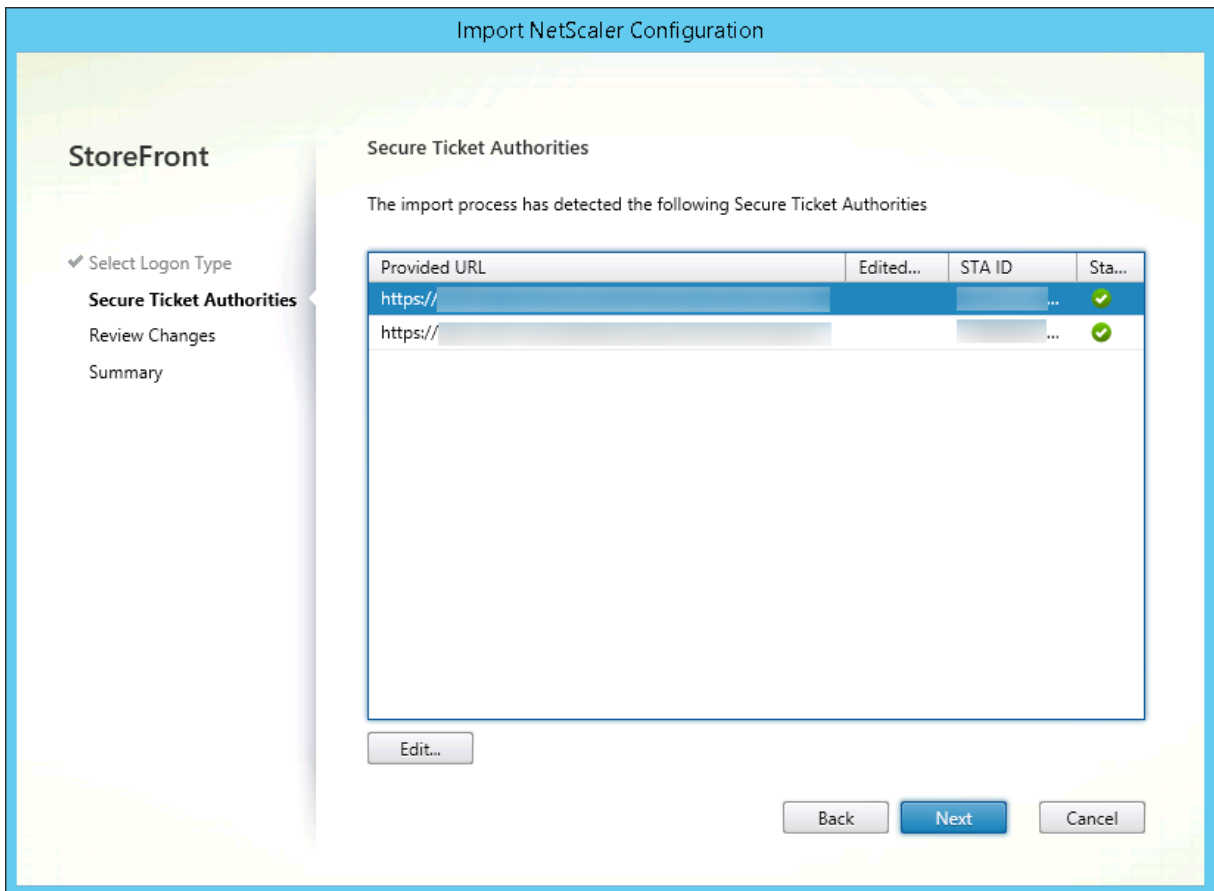

Logon type in console	LogonType in JSON file	Callback URL required
Domain	Domain	No
Domain and security token	DomainAndRSA	No
Security token	RSA	Yes
Smart card - no fallback	SmartCard	Yes
Smart card - domain	SmartCardDomain	Yes
Smart card - domain and security token	SmartCardDomainAndRSA	Yes
Smart card - security token	SmartCardRSA	Yes
Smart card - SMS authentication	SmartCardSMS	Yes
SMS authentication	SMS	Yes

If a callback URL is required, StoreFront will autofill Callback URL based on the gateway URL found in the ZIP file. You can change this to any valid URL that points back to the NetScaler Gateway vServer IP.

If you want to use [Smart Access](#), a Callback URL is required.

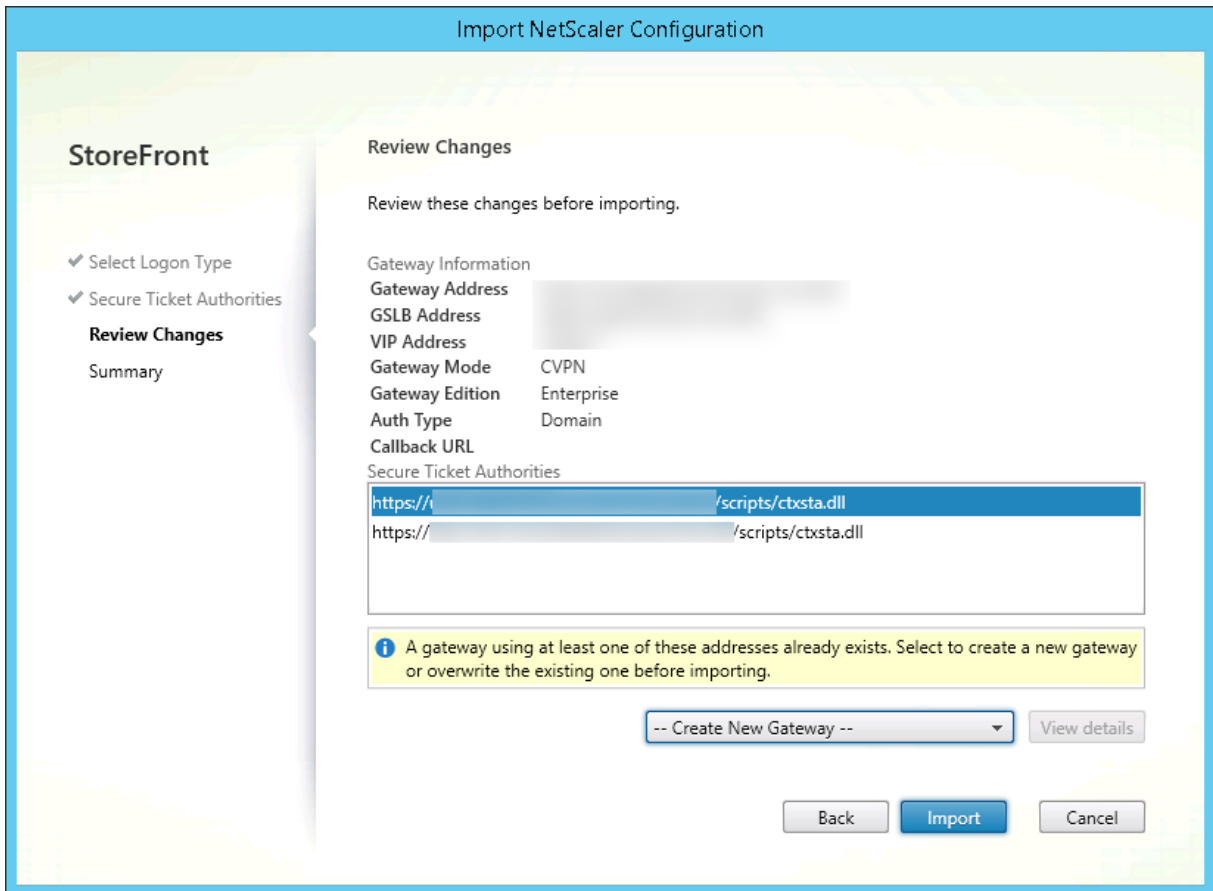

6. Click **Next**.

1. StoreFront contacts all the STA (Secure Ticket Authorities) server URLs listed in the ZIP file using DNS, and validates that they are functional STA ticketing servers. The import will not continue if one or more of the STA URLs is invalid.

8. Click **Next**.

1. Review the details of the import. If a gateway with the same gateway URL and port combination (Gateway:port) already exists, use the drop-down to select a gateway to overwrite it, or create a new gateway.

StoreFront uses the GatewayURL:port combination to determine whether a gateway you are trying to import matches an existing gateway that you may wish to update. If a gateway has a different GatewayURL:port combination then StoreFront treats this as a new gateway. This table of gateway settings shows which settings you can update.

Gateway Setting	Can be updated
Gateway URL:Port Combination	No
GSLB URL	Yes
Netscaler Trust Certificate & Thumbprint	Yes
Callback URL	Yes
Receiver for Web Site URL	Yes
Gateway Address/VIP	Yes
STA URL and STA ID	Yes
All Logon Types	Yes

1. Click **Import**. If the StoreFront server is part of a server group, a message is displayed reminding you to propagate the imported gateway settings to the other servers in the group.

## 11. Click **Finish**.

To import another vServer configuration, repeat the steps above.

### Note

The default gateway for a store is the gateway that native Citrix Receivers try to connect through unless they are configured to use a different gateway. If no gateways are configured for the store, the first gateway imported from the ZIP file will become the default gateway used by native Citrix Receivers. Importing subsequent gateways does not change the default gateway already set for the store.

## Import multiple NetScaler Gateways using PowerShell

### Read-STFNetScalerConfiguration

- Copy the ZIP file to the desktop of the currently logged on StoreFront administrator.
- Read the contents of the NetScaler ZIP file into memory and look at the three gateways it contains using their index values.

```
1 $ImportedGateways = Read-STFNetScalerConfiguration -path "$env:
  USERPROFILE\desktop\GatewayConfig.zip"
```

View the three gateway objects in memory which were read in from the Netscaler ZIP import package using the Read-STFNetScalerConfiguration cmdlet.

```
1 $ImportedGateways.Document.Gateways[0]
2 $ImportedGateways.Document.Gateways[1]
3 $ImportedGateways.Document.Gateways[2]
4
5 GatewayMode           : CVPN
6 CallbackUrl           :
7 GslbAddressUri        : https://gslb.example.com/

      ReceiverForWebSite }
```

### Import-STFNetScalerConfiguration without specifying a CallbackURL

Copy the ZIP file to the desktop of the currently logged in StoreFront administrator. Read in the NetScaler ZIP import package into memory and look at the three gateways it contains using their index values.

```
1 $ImportedGateways = Read-STFNetScalerConfiguration -path "$env:
  USERPROFILE\desktop\GatewayConfig.zip"
```

Import three new gateways into StoreFront using the Import-STFNetScalerConfiguration cmdlet and specifying the gateway indexes you require. Using the -Confirm:\$False parameter prevents the Powershell GUI from prompting you to allow every gateway to be imported. Remove this if you wish to carefully import one gateway at a time.

```
1 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 0 -Confirm:$False
2 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 1 -Confirm:$False
3 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 2 -Confirm:$False
```

### Import-STFNetScalerConfiguration specifying your own CallbackURL

Import three new gateways into StoreFront using the Import-STFNetScalerConfiguration cmdlet and specify a callback URL of your choice using the -callbackURL parameter.

```
1 $ImportedGateways = Read-STFNetScalerConfiguration -path "$env:
  USERPROFILE\desktop\GatewayConfig.zip"
2
3 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 0 -CallbackUrl "https://emeagatewaycb.example.com:443 -
  Confirm:$False
4
5 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 1 -CallbackUrl "https://emeagatewaycb.example.com:444 -
  Confirm:$False
6
7 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 2 -CallbackUrl "https://emeagatewaycb.example.com:445 -
  Confirm:$False
```

### **Import-STFNetScalerConfiguration override the authentication method stored in the import file and specify your own CallbackURL**

- Import three new gateways into StoreFront using the Import-STFNetScalerConfiguration cmdlet and specify a callback URL of your choice using the -callbackURL parameter.

```
1 $ImportedGateways = Read-STFNetScalerConfiguration -path "$env:
  USERPROFILE\desktop\GatewayConfig.zip"
2
3 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 0 -LogonType "SmartCard" -CallbackUrl "https://
  emeagatewaycb.example.com:443" -Confirm:$False
4
5 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 1 -LogonType "SmartCard" -CallbackUrl "https://
  emeagatewaycb.example.com:444" -Confirm:$False
6
7 Import-STFNetScalerConfiguration -Configuration $ImportedGateways -
  GatewayIndex 2 -LogonType "SmartCard" -CallbackUrl "https://
  emeagatewaycb.example.com:445" -Confirm:$False
```

## **Configure NetScaler Gateway connection settings**

October 15, 2018

The tasks below enable you to update details of the NetScaler Gateway deployments through which users access your stores. For more information about configuring NetScaler Gateway for StoreFront, see [Using WebFront to Integrate with StoreFront](#).

If you make any changes to your NetScaler Gateway deployments, ensure that users who access stores through these deployments update Citrix Receiver with the modified connection information. Where a Citrix Receiver for Web site is configured for a store, users can obtain an updated Citrix Receiver provisioning file from the site. Otherwise, you can [export a provisioning file](#) for the store and make this file available to your users.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

## Change general NetScaler Gateway settings

Use the Change General Settings task to modify the NetScaler Gateway deployment names shown to users and to update StoreFront with changes to the virtual server or user logon point URL, and the deployment mode of your NetScaler Gateway infrastructure.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and pane, click Manage Netscaler Gateways.
3. Specify a name for the NetScaler Gateway deployment that will help users to identify it.

Users see the display name you specify in Citrix Receiver, so include relevant information in the name to help users decide whether to use that deployment. For example, you can include the geographical location in the display names for your NetScaler Gateway deployments so that users can easily identify the most convenient deployment for their location.

4. Enter the URL of the virtual server or user logon point (for Access Gateway 5.0) for your deployment. Specify the product version used in your deployment.

The fully qualified domain name (FQDN) for your StoreFront deployment must be unique and different from the NetScaler Gateway virtual server FQDN. Using the same FQDN for StoreFront and the NetScaler Gateway virtual server is not supported.

5. If your deployment is running Access Gateway 5.0, continue to Step 7. Otherwise, specify the subnet IP address of the NetScaler Gateway appliance, if necessary. A subnet IP address is required for Access Gateway 9.3 appliances, but optional for more recent product versions.

The subnet address is the IP address that NetScaler Gateway uses to represent the user device when communicating with servers on the internal network. This can also be the mapped IP address of the NetScaler Gateway appliance. Where specified, StoreFront uses the subnet IP address to verify that incoming requests originate from a trusted device.

6. If your appliance is running NetScaler Gateway 10.1 - 11.0, Access Gateway 10 - 11.0, or Access Gateway 9.3, select from the Logon type list the authentication method you configured on the appliance for Citrix Receiver users.

The information you provide about the configuration of your NetScaler Gateway appliance is added to the provisioning file for the store. This enables Citrix Receiver to send the appropriate connection request when contacting the appliance for the first time.

- If users are required to enter their Microsoft Active Directory domain credentials, select Domain.
- If users are required to enter a tokencode obtained from a security token, select Security token.
- If users are required to enter both their domain credentials and a tokencode obtained from a security token, select Domain and security token.

- If users are required to enter a one-time password sent by text message, select SMS authentication.
- If users are required to present a smart card and enter a PIN, select Smart card.

If you configure smart card authentication with a secondary authentication method to which users can fall back if they experience any issues with their smart cards, select the secondary authentication method from the Smart card fallback list.

7. If your deployment consists of NetScaler Gateway 10.1 - 11.0, Access Gateway 10 - 11.0, Access Gateway 9.3, or a single Access Gateway 5.0 appliance, complete the NetScaler Gateway authentication service URL in the Callback URL box. StoreFront automatically appends the standard portion of the URL.

Enter the internally accessible URL of the appliance. StoreFront contacts the NetScaler Gateway authentication service to verify that requests received from NetScaler Gateway originate from that appliance.

### **Manage Access Gateway 5.0 appliances**

Use the Manage Appliances task to add, edit, or remove from StoreFront the IP addresses or FQDNs of the appliances in your Access Gateway 5.0 cluster.

### **Enable silent user authentication through Access Controller**

Use the Enable Silent Authentication task to add, edit, or remove URLs for the authentication service running on the Access Controller servers for your Access Gateway 5.0 cluster. Enter URLs for multiple servers to enable fault tolerance, listing the servers in order of priority to set the failover sequence. StoreFront uses the authentication service to authenticate remote users so that they do not need to re-enter their credentials when accessing stores.

### **Manage Secure Ticket Authorities**

Use the Secure Ticket Authority task to update the list of Secure Ticket Authorities (STAs) from which StoreFront obtains user session tickets and to configure session reliability. The STA is hosted on XenDesktop and XenApp servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop and XenApp resources.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the Stores node in the left pane of the Citrix StoreFront management console and, in the results pane, select a NetScaler Gateway deployment. In the Actions pane, click Manage NetScaler Gateways.

3. Click Add to enter the URL for a server running the STA. Specify URLs for multiple STAs to enable fault tolerance, listing the servers in order of priority to set the failover sequence. To modify a URL, select the entry in the Secure Ticket Authority URLs list and click Edit. Select a URL in the list and click Remove to stop StoreFront obtaining session tickets from that STA.
4. If you want XenDesktop and XenApp to keep disconnected sessions open while Citrix Receiver attempts to reconnect automatically, select the Enable session reliability check box. If you configured multiple STAs and want to ensure that session reliability is always available, select the Request tickets from two STAs, where available check box.

When the Request tickets from two STAs, where available check box is selected, StoreFront obtains session tickets from two different STAs so that user sessions are not interrupted if one STA becomes unavailable during the course of the session. If, for any reason, StoreFront is unable to contact two STAs, it falls back to using a single STA.

## Remove NetScaler Gateway deployments

In the **Actions** pane, use the Remove task from **Manage NetScaler Gateways** to delete the details of a NetScaler Gateway deployment from StoreFront. Once a NetScaler Gateway deployment is removed, users are no longer be able to access stores through that deployment.

## Configure two URLs for the same NetScaler Gateway

October 25, 2018

In StoreFront, you can add a single NetScaler Gateway URL from the StoreFront management console in Manage NetScaler Gateways > Add or Edit. It is also possible to add both a public NetScaler Gateway URL and a GSLB (Global Server Load Balancing) URL in Manage NetScaler Gateways > imported from file.

This article shows you how to use PowerShell cmdlets and the StoreFront PowerShell SDK to use an optional parameter, `-gslburl`, to set the `GslbLocation` attribute of a gateway. This feature simplifies the NetScaler Gateway administration in StoreFront in the following use cases:

1. **GSLB and multiple NetScaler Gateways.** Use GSLB and multiple NetScaler Gateways to load balance remote connections to published resources in two or more locations within a large global Citrix deployment.
2. **Single NetScaler Gateway using a public or private URL.** Use the same NetScaler Gateway for external access using a public URL, and for internal access using a private URL.

This is an advanced feature. If you are new to GSLB concepts, see the Related information links at the end of this article.

This feature offers the following benefits:

- Support two simultaneous URLs for a single gateway object.
- Users can switch between two different URLs to access the NetScaler Gateway without the administrator reconfiguring the StoreFront gateway object to match the gateway URL the user wants to use.
- Shorter setup and test times to validate the StoreFront gateway configuration when using multiple GSLB gateways.
- Use the same NetScaler Gateway object in StoreFront inside the DMZ for both external and internal access.
- Support both URLs for optimal gateway routing. For more information on optimal gateway routing, see [Set up highly available multi-site stores](#).

## Deployment considerations when using two Gateway URLs

### Important

Before configuring a second gateway URL using the `-gslburl` parameter, Citrix recommends reviewing what server certificates you have in place and how your organization performs DNS resolution. Any URLs that you want to use in your NetScaler and StoreFront deployment must be present in your server certificates. For more information about server certificates, see [Plan gateway and server certificate usage](#).

### DNS

- **Split DNS.** It is common for large enterprises to use split DNS. Split DNS involves using different namespaces and different DNS servers for public and private DNS resolution. Check if you have the existing DNS infrastructure to support this.
- **Single URL for external and internal access to published resources.** Decide if you want to use the same URL to access published resources from both outside and inside your corporate network, or consider if two different URLs are acceptable such as `example.com` and `example.net`.

### Server certificate examples

This section contains example server certificate deployments when using two Gateway URLs.

- **Example server certificate for a load balanced StoreFront deployment**

A privately signed wildcard server certificate should contain the FQDN `*.storefront.example.net`.

Or

A privately signed SAN server certificate should contain all the FQDNs needed to load balance three StoreFront servers.

`loadbalancer.storefront.example.net`

`server1.storefront.example.net`

`server2.storefront.example.net`

`server3.storefront.example.net`

Set the host base URL of the Storefront server group to be the shared FQDN, which resolves to the load balancer IP address.

`loadbalancer.storefront.example.net`

- **Example server certificate for a group of XenApp and XenDesktop 7.x Delivery Controllers**

A privately signed wildcard server certificate should contain the FQDN `*.xendesktop.example.net`.

Or

A privately signed SAN server certificate should contain all the server FQDNs needed for a XenDesktop site containing four Controllers.

`XD1A.xendesktop.example.net`

`XD1B.xendesktop.example.net`

`XD2A.xendesktop.example.net`

`XD2B.xendesktop.example.net`

- **Example server certificate for a NetScaler Gateway which is accessed both externally and internally using split DNS**

A publically signed SAN server certificate for both external and internal access should contain both the external and internal FQDNs.

`gateway.example.com`

`gateway.example.net`

- **Example server certificate for all GSLB Gateways which are accessed externally**

A publically signed SAN server certificate for external access through GSLB should contain the FQDNs.

`gslbdomain.example.com`

`emeagateway.example.com`

`usgateway.example.com`

`apacgateway.example.com`

This allows the user to access the closest gateway using GSLB or to pick a gateway in the location of their choice using its unique FQDN.

### **Use Case #1: GSLB and multiple NetScaler Gateways**

The administrator uses GSLB and multiple NetScaler Gateways to load balance remote connections to published resources in two or more locations within a large global Citrix deployment.

In this example:

- Each location or data center contains at least one gateway, one or more StoreFront servers, and one or more XenApp and XenDesktop Controllers to provide published resources for that location.
- Each GSLB service configured on the GSLB NetScalers within the global deployment represents a gateway VPN vServer. All of the StoreFront servers in the deployment must be configured to contain all of the NetScaler Gateway vServers that make up the GSLB layer.
- The GSLB NetScaler Gateways are used in active/active mode but can also provide failover if the network connection, DNS, gateway, StoreFront server or XenApp and XenDesktop Controllers at one location fail. Users are automatically directed to another gateway if a GSLB service is unavailable.
- External clients are directed to the closest gateway based on the configured GSLB load balancing algorithm such as round trip time (RTT) or Static Proximity when making remote connections.
- The unique URL for each gateway allows users to manually select which data center they want to launch resources from by choosing the location-specific URL for the gateway they want to use.
- GSLB can be bypassed when GSLB or a DNS delegation is not working as expected. Users can continue to access remote resources at any data center using its location-specific URL until any GSLB related issues are resolved.

### **Use Case #2: Single NetScaler Gateway using a public or private URL**

The administrator uses the same NetScaler Gateway for both external access using a public URL, and also internally using a private URL.

In this example:

- The administrator wants all access to published resources and HDX launch traffic to pass through a NetScaler Gateway even if the client is internal.
- The NetScaler is located in a DMZ.
- There are two different network routes to the NetScaler Gateway through the two firewalls on either side of the DMZ.
- The public-facing, external namespace is different from the internal namespace.

## PowerShell cmdlet examples

Use the PowerShell cmdlets **Add-STFRoamingGateway** and **Set-STFRoamingGateway** with the parameter, **-gslburl**, to set the **GslbLocation** attribute on the StoreFront gateway object. For example:

```
1 Add-STFRoamingGateway -Name "EMEAGateway" -GatewayUrl "https://
  emeagateway.example.com" -GSLBurl "https://gslb.example.com" -
  SubnetIPAddress "10.0.0.1" -CallbackUrl "https://emeagateway.example
  .com" -LogonType "DomainAndRSA" -SmartCardFallbackLogonType "None" -
  Version "Version10_0_69_4" -SecureTicketAuthorityUrls "https://emea-
  controller.example.com/scripts/ctxsta.dll,https://us-controller.
  example.com/scripts/ctxsta.dll,https://apac-controller.example.com/
  scripts/ctxsta.dll"
2 Set-STFRoamingGateway -Name "EMEAGateway" -GatewayUrl "https://
  emeagateway.example.com" -GSLBurl "https://gslb.example.com"
3 Get-STFRoamingGateway -Name "EMEAGateway" (returns just the EMEA
  gateway object)
4 Or
5 Get-STFRoamingGateway (returns all gateway object configured in
  StoreFront)
```

For use case #1, you can remove the **GSLBurl** from the “EMEAGateway” by setting its **GslbLocation** to **NULL**. The following PowerShell modifies the gateway object **\$EMEAGateway** stored in memory. **Set-STFRoamingGateway** can then be passed **\$EMEAGateway** to update the StoreFront config and remove the **GSLBurl**.

```
1 $EMEAGateway = Get-STFRoamingGateway
2
3 $EMEAGateway.GslbLocation = $Null
4
5 Set-STFRoamingGateway -Gateway $EMEAGateway
```

For use case #1, the following gateways are returned using **Get-STFRoamingGateway**:

```
1 Name: EMEAGateway
2 Location: https://emeagateway.example.com/ (Unique URL for the EMEA
  Gateway)
3
4 GslbLocation: https://gslb.example.com/ (GSLB URL for all three
  gateways)
5
6 Name: USGateway
7 Location: https://USgateway.example.com/ (Unique URL for the US
  Gateway)
8
```

```
9  GslbLocation: https://gslb.example.com/ (GSLB URL for all three
    gateways)
10
11 Name: APACGateway
12  Location: https://APACgateway.example.com/ (Unique URL for the APAC
    Gateway)
13
14 GslbLocation: https://gslb.example.com/ (GSLB URL for all three
    gateways)
```

For use case #2: the following gateways are returned using **Get-STFRoamingGateway**:

```
1  Name: EMEAGateway
2  Location: https://emeagateway.example.com/ (Public URL for the Gateway
   )
3
4  GslbLocation: https://emeagateway.example.net/ (Private URL for the
   Gateway)
```

For use case #1, Optimal Gateway Routing is returned using **Get-STFStoreRegisteredOptimalLaunchGateway**:

```
1  $StoreObject = Get-STFStoreService -SiteId 1 -VirtualPath "/Citrix/<
    YourStore>"
2
3  Get-STFStoreRegisteredOptimalLaunchGateway -StoreService $StoreObject
4
5  Hostnames:      {
6  emegateway.example.com, gslb.example.com }
7
8  Hostnames:      {
9  usgateway.example.com, gslb.example.com }
10
11 Hostnames:      {
12 apacgateway.example.com, gslb.example.com }
```

### **GSLB URL or Internal URL for each Gateway is stored in the Roaming service web.config file**

StoreFront does not display the GSLB URL or internal URL for each Gateway within the StoreFront management console, however it is possible to view the configured GSLBLocation path for all GSLB gateways by opening the roaming service Web.Config file location in C:\inetpub\wwwroot\Citrix\Roaming\web.config on the StoreFront server.

### **Use Case #1 Gateways in Roaming web.config file**

```

## Load balancing with NetScaler

October 15, 2018

This article contains the information needed to use NetScaler to load balance two or more StoreFront servers.

### Configure a StoreFront server group and NetScaler load balancing

#### Plan your load balanced StoreFront deployment

This article provides guidance on how to deploy a StoreFront server group containing two or more StoreFront servers in all active load balanced configuration. The article provides details of how to configure a NetScaler appliance to load balance incoming requests from Citrix Receiver/Citrix Receiver for

Web between all of the StoreFront nodes in the server group and how to configure the new Storefront Monitor for use with a NetScaler or third party load balancer.

For load balancing configuration examples, see the sections “Scenario 1” and “Scenario 2” below.

#### **Tested with the following environment**

- Four Windows Server 2012 R2 StoreFront 3.0 nodes in a single server group.
- One NetScaler 10.5 load balancer configured for Least Connection and CookieInsert “sticky” load balancing.
- One Windows 8.1 test client with Fiddler 4.0 and Citrix Receiver for Windows 4.3 installed.

#### **Server certificate requirements for the load balanced deployment if you intend to use HTTPS**

Review the section [Plan gateway and server certificate usage](#).

Consider the following options before purchasing a certificate from a commercial certificate authority or issuing one from your enterprise CA.

- **Option 1:** Use a \*.example.com wildcard certificate on both the NetScaler load balancing vServer and on the StoreFront server group nodes. This simplifies the configuration and allows you to add extra StoreFront servers in the future without the need to replace the certificate.
- **Option 2:** Use a certificate including Subject Alternative Names (SANs) on both the NetScaler load balancing vServer and on the StoreFront server group nodes. Extra SANs within the certificate that match all of StoreFront server fully qualified domain names (FQDNs) are optional, but recommended, as this allows greater flexibility in the StoreFront deployment. Include a SAN for email-based discovery discoverReceiver.example.com.

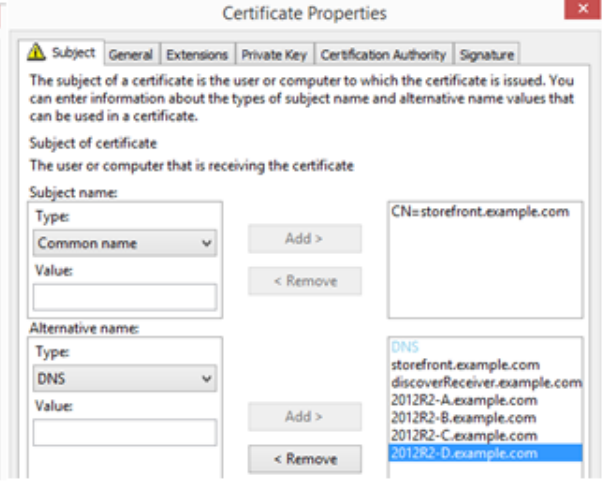

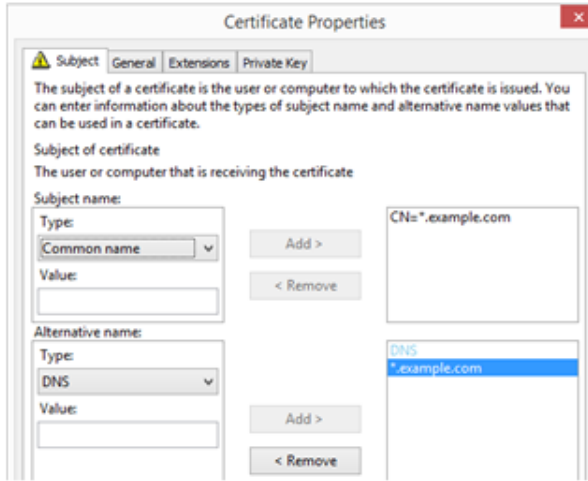

For details of email-based discovery configuration, see <http://blogs.citrix.com/2013/04/01/configuring-email-based-account-discovery-for-citrix-receiver/>.

**Note:** When exporting the private key associated with the certificate is not feasible. Use two separate certificates: one on the NetScaler load balancing vServer and a different certificate on the StoreFront server group nodes. Both certificates must include Subject Alternative Names.

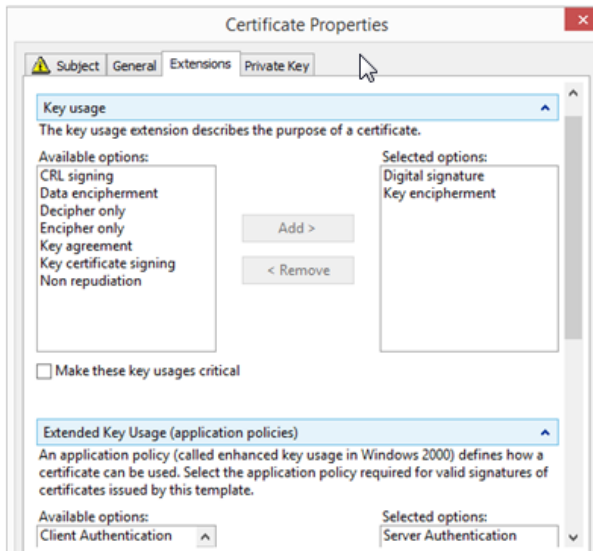

## Example Web server certificates

### Option 1: Wildcard certificate

### Option 2: SAN certificate with every StoreFront server

### Common Properties

**Create a server certificate for the NetScaler load balancer and all StoreFront servers**

**Import a certificate issued from a Windows CA onto a NetScaler appliance using OpenSSL**

- WinSCP is a useful third party and free tool to move files from a Windows machine to a NetScaler file system. Copy certificates for import to the **/nsconfig/ssl/** folder within the NetScaler file system.
- You can also use OpenSSL tools on the NetScaler to extract the certificate and key from a **PKCS12/PFX** file to create a two separate .CER and .KEY X.509 files in PEM format that NetScaler can use.

1. Copy the PFX file into **/nsconfig/ssl/** on the NetScaler appliance or VPX.
2. Open the NetScaler command line interface (CLI).
3. Type **Shell** to switch to exit the NetScaler CLI and switch to the FreeBSD shell.
4. Change directory using **cd /nsconfig/ssl/**.
5. Run **openssl pkcs12 -in <imported cert file>.pfx -nokeys -out <certfilename>.cer** and enter the PFX password when prompted.
6. Run **openssl pkcs12 -in <imported cert file>.pfx -nocerts -out <keyfilename>.key** and enter the PFX password when prompted, and then set the private key PEM passphrase to protect the .KEY file.
7. Run **ls -al** to check the .CER and .KEY files have been successfully created inside **/nsconfig/ssl/**.
8. Type **Exit** to return to the NetScaler CLI.

#### **Configure the server certificate on the NetScaler after it is imported**

1. Log onto the NetScaler management GUI.
2. Select Traffic Management > SSL > SSL Certificates and click Install.
3. On the Install Certificate window, enter the certificate and private key pair names.
  - Select the .cer certificate file on the NetScaler file system under **/nsconfig/ssl/**.
  - Select the .key file containing the private key from the same location.

### Install Certificate

Certificate-Key Pair Name\*

Certificate and Key files are stored in the folder /nsconfig/ssl/ on appliance.

### Create DNS records for the StoreFront server group load balancer

Create a DNS A and PTR record for your chosen shared FQDN. Clients within your network use this FQDN to access the StoreFront server group using the NetScaler load balancer.

Example - **storefront.example.com** resolves to the load balancing vServer virtual IP (VIP).

### Scenario 1: An end to end HTTPS 443 secure connection between the client and NetScaler load balancer and also between the load balancer and two or more StoreFront 3.0 servers.

This scenario uses a modified StoreFront monitor using port 443.

### Add individual StoreFront server nodes to the NetScaler load balancer

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Load Balancing > Servers > Add** and add each of the four StoreFront nodes to be load balanced.

Example = 4 x 2012R2 StoreFront Nodes called 2012R2-A to -D

3. Use IP based server configuration and enter the server IP address for each StoreFront node.

The screenshot shows the NetScaler management GUI. On the left is a navigation tree with 'Servers' selected under 'Load Balancing'. The main pane shows the breadcrumb 'NetScaler > Traffic Management > Load Balancing > Servers' and a table of configured servers.

Name	State	IPAddress / Domain
2012R2-A	Enabled	172.27.44.90
2012R2-B	Enabled	172.27.44.91
2012R2-C	Enabled	172.27.44.92
2012R2-D	Enabled	172.27.44.93

### Define a StoreFront monitor to check the status of all StoreFront nodes in the server group

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Load Balancing > Monitors > Add** and add a new monitor called StoreFront and accept all default settings.
3. From the **Type** drop down menu, select **StoreFront**.
4. Make sure the **Secure** check box is checked if using HTTPS connections between your load balancing vServer and StoreFront; otherwise leave this option disabled.
5. Specify the store name under the Special Parameters tab.
6. Check the **Check Backend Services** check box under the Special Parameters tab. This option enables monitoring of services running on the StoreFront server. StoreFront services are monitored by probing a Windows service that runs on the StoreFront server, which returns the status of all running StoreFront services.

## Standard Parameters Tab

The 'Create Monitor' dialog box has a title bar 'Create Monitor'. It contains the following fields and options:

- Name\*: StoreFront
- Type\*: STOREFRONT
- Standard Parameters | Special Parameters (tabbed)
- Interval: 5 | Second
- Destination IP: . . . | IPv6
- Response Time-out: 2 | Second
- Destination Port: Bound Service
- Down Time: 30 | Second
- Enabled
- Reverse
- Transparent
- LRTM (Least Response Time using Monitoring)
- Secure

## Special Parameters Tab

The 'Configure Monitor' dialog box has a title bar 'Configure Monitor' and a 'Back' button. It contains the following fields and options:

- Name: StoreFront
- Type: STOREFRONT
- Standard Parameters | Special Parameters (tabbed)
- Store Name: Store
- Storefront Account Service
- Check Backend Services
- OK | Close

**Create an HTTPS 443 service group containing all of the StoreFront servers**

1. Within your Service Group, select the Members option on the right hand side and add all of the StoreFront server nodes you defined previously in the Servers section.
2. Set the SSL port and give each node a unique server ID as they are added.

### Create Service Group Member

IP Based  Server Based

Select Server\*

3. On the Monitors tab, select the StoreFront monitor you created earlier.

### Monitors

Add Binding Edit Binding Unbind Edit Monitor

Monitor Name	Weight	State
StoreFront	1	✓

Close

4. On the Certificates tab, bind the server certificate you imported earlier.

5. Bind the CA certificate used to sign the server certificate you imported earlier and any other CAs that might be part of the PKI chain of trust.

### Create a load balancing vServer for user traffic

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Load Balancing > Virtual Servers > Add** to create a new vServer.
3. Select the load balancing method for the vServer. Common choices for StoreFront load balancing are **round robin** or **least connection**.

4. Bind the **Service Group** you created earlier to the load balancing vServer.
5. Bind the same server and CA certificate you previously bound to the service group, to the load balancing vServer.
6. From within the load balancing vServer menu, select **Persistence** on the right hand side and set the persistence method to be **CookieInsert**.
7. Name the cookie. For example, **NSC\_SFPersistence**, as this makes it easy to identify in Fiddler traces during debugging.
8. Set backup persistence to **None**.

**Persistence**

Persistence\*

IPv6 Mask Length  
128

OK

**Scenario 2: HTTPS termination - HTTPS 443 communication between the client and NetScaler load balancer and HTTP 80 connections between the load balancer and the StoreFront 3.0 servers behind it.**

This scenario uses the default StoreFront monitor using port 8000.

**Add individual StoreFront server servers to the NetScaler load balancer**

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Load Balancing > Servers > Add** and add each of the four StoreFront servers to be load balanced.  
Example = 4 x 2012R2 Storefront servers called 2012R2-A to -D.
3. Use IP based Server configuration and enter the server IP address for each Storefront server.

Name	State	IP Address / Domain
▶ 2012R2-A	Enabled	172.27.44.90
▶ 2012R2-B	Enabled	172.27.44.91
▶ 2012R2-C	Enabled	172.27.44.92
▶ 2012R2-D	Enabled	172.27.44.93

### Define an HTTP 8000 StoreFront monitor to check the status of all StoreFront servers in the server group

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Monitors > Add** and add a new monitor called StoreFront.
3. Add a name for the new monitor and accept all default settings.
4. Select **Type** from the drop down menu as **StoreFront**.
5. Specify the store name under the Special Parameters tab.
6. Enter **8000** into destination port, as this matches the default monitor instance that is created on each StoreFront server.
7. Tick the **Check Backend Services** check box under the Special Parameters tab. This option enables monitoring of services running on the StoreFront server. StoreFront services are monitored by probing to a Windows service that runs on the StoreFront server, which returns the status of all running StoreFront services.

### Create an HTTP 80 service group containing all of the StoreFront servers

1. Within your Service Group, select the Members option on the right hand side and add all of the StoreFront server nodes you defined previously in the Servers section.
2. Set the HTTP port to 80 and give each server a unique server ID as you add them.
3. On the Monitors tab, select the StoreFront monitor you created earlier.

### Create an HTTPS terminating load balancing vServer for user traffic

1. Select **Traffic Management > Load Balancing > Virtual Servers > Add** to create a new vServer.

2. Select the load balancing method vServer will use. Common choices for StoreFront load balancing are **round robin** or **least connection**.
3. Bind the **Service Group** you created earlier to the load balancing vServer.
4. Bind the same server and CA certificate you previously bound to the service group, to the load balancing vServer.

**Note:** If the client is not allowed to store the HTTP cookie, the subsequent requests do not have the HTTP cookie and **Persistence** is not used.

5. From within the load balancing vServer menu, select **Persistence** and set the persistence method to be **CookieInsert**.
6. Name the cookie. For example, **NSC\_SFPersistence**, as this makes it easy to identify in Fiddler traces during debugging.
7. Set backup persistence to **None**.

## Create a load balancing vServer for subscription synchronization between server groups

Considerations before creating a load balancing vServer include the following:

- **Option 1:** Create a single vServer: To load balance only user traffic. This is all that is needed if performing only ICA launches of published apps and desktops. (Mandatory and usually all that is required.)
- **Option 2:** Create a pair of vServers: One to load balance user traffic for performing ICA launches of published apps and desktops and another for load balancing subscription data synchronization operations. (Necessary only when propagating subscription data between two or more load balanced StoreFront server groups in a large multisite deployment.)

If a multisite deployment consists of two or more StoreFront server groups located in separate geographic locations, you can replicate subscription data between them using a pull strategy on a repeating schedule. StoreFront subscription replication uses TCP port 808, so using an existing load balancing vServer on HTTP port 80 or HTTPS 443 fails. To provide high availability for this service, create a second vServer on each NetScaler in your deployment to load balance TCP port 808 for each of the StoreFront server groups. When configuring the replication schedule, specify a server group address that matches the subscription synching vServer virtual IP address. Ensure the server group address is the FQDN of the load balancer for the server group at that location.

### Configure a service group for subscription synchronization

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Service Groups > Add** and add a new service group.
3. Change the protocol to **TCP**.
4. Within your Service Group, select the **Members** option on the right hand side and add all of the StoreFront server nodes you defined previously in the Servers section.
5. On the **Monitors** tab, select the TCP monitor.

Monitors			
Monitor Name	Weight	State	Passive
tcp	1	✓	✗

Buttons: Add Binding, Edit Binding, Unbind, Edit Monitor, Close

### Create a load balancing vServer for subscription synchronization between server groups

1. Log onto the NetScaler management GUI.
2. Select **Traffic Management > Service Groups > Add** and add a new service group.
3. Set the load balancing method to **round robin**.
4. Change the protocol to **TCP**.
5. Enter **808** **\*\*and NOT 443\*\*** as the port number.

## Load Balancing Virtual Server

### Basic Settings

Name\*

Protocol\*

IP Address Type\*

IP Address\*

  IPv6

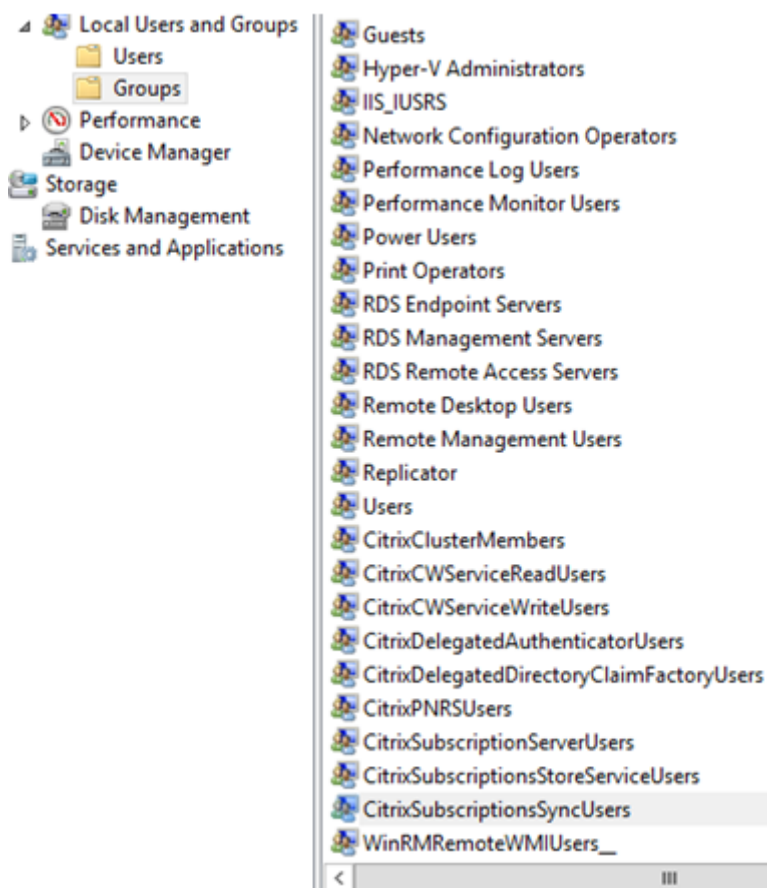

Port\*

 ?

### Membership within CitrixSubscriptionsSyncUsers

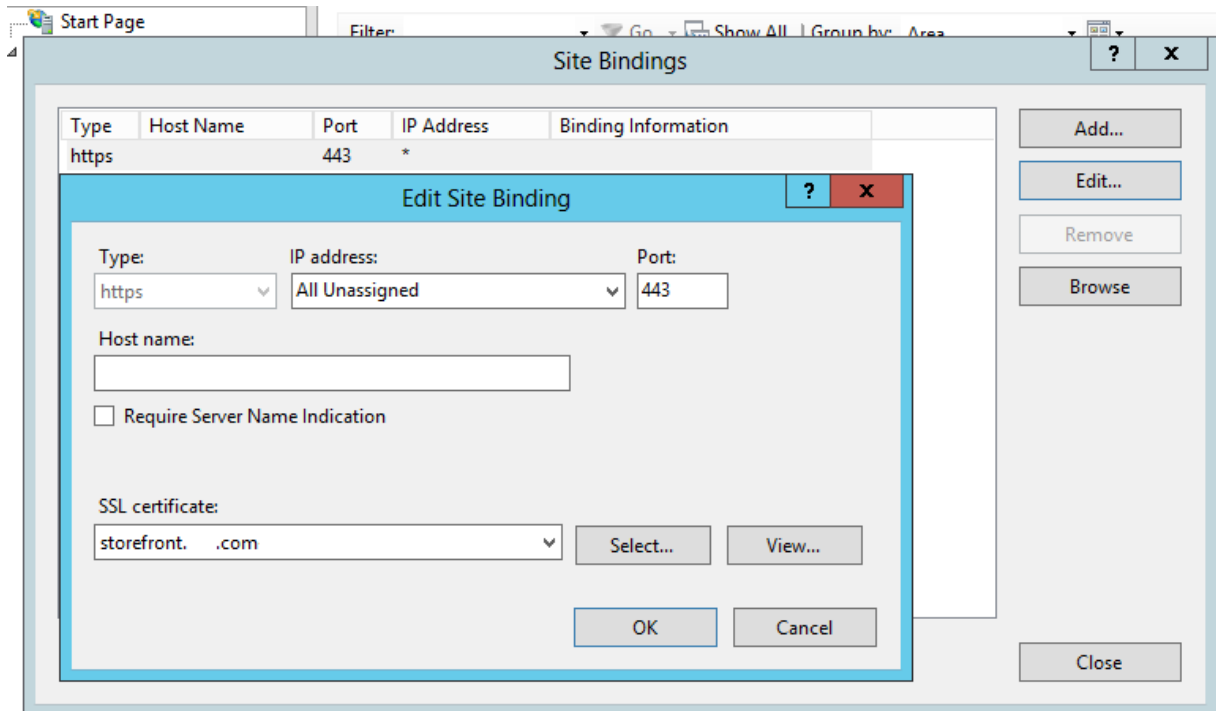

For **StoreFront server A** at **Location A** to request and pull subscription data from **server B** at a different location, server A must be a member of the **CitrixSubscriptionsSyncUsers** local security group on server B. The **CitrixSubscriptionsSyncUsers** local group contains an access control list of all remote StoreFront servers authorized to pull subscription data from a particular server. For bidirectional subscription synchronization, server B must also be a member of the **CitrixSubscriptionsSyncUsers** security group on server A to pull subscription data from it.

### **Configure the StoreFront server group for load balancing**

1. Import the same certificate and private key that was deployed on the NetScaler load balancing vServer to every StoreFront node in the server group.
2. Create an HTTPS binding in IIS on every StoreFront node, and then bind the certificate you imported earlier to it.

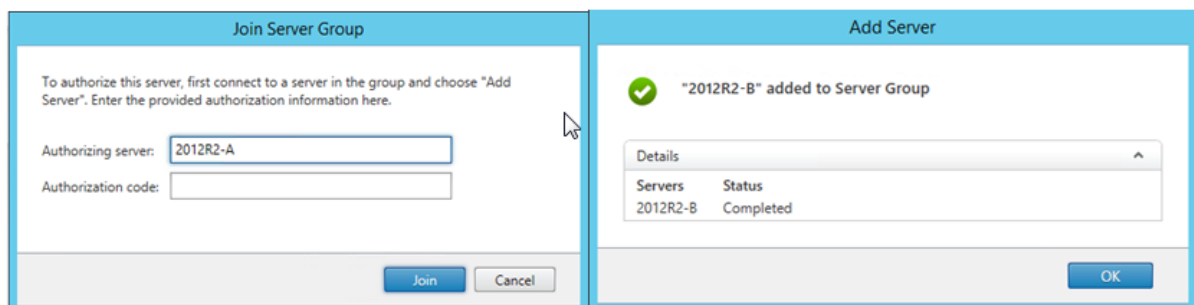

3. Install StoreFront on every node in the server group.

4. During installation of StoreFront, set the host base URL on the primary node to be the shared FQDN used by all members of the server group. You must use a certificate containing the load balanced FQDN as a Common Name (CN) or Subject Alternative Name (SAN).

- 1 See the [\[Create a server certificate for the NetScaler load balancer and StoreFront servers\]](/en-us/storefront/3-12/integrate-with-netscaler-and-netscaler-gateway/load-balancing-with-netscaler.html#create-a-server-certificate-for-the-netscaler-load-balancer-and-storefront-servers) (/en-us/storefront/3-12/integrate-with-netscaler-and-netscaler-gateway/load-balancing-with-netscaler.html#create-a-server-certificate-for-the-netscaler-load-balancer-and-storefront-servers).

5. When you complete the initial StoreFront configuration, join each of the nodes, one after the other, to the server group using the primary node.

6. Select **Server Group > Add Server > Copy the Authorization Code** to the joining Server.

7. Propagate the configuration from the primary node to all other server group nodes in the group.

8. Test the load balanced server group using a client that can contact and resolve the shared FQDN of the load balancer.

### **Citrix Service Monitor**

To enable external monitoring of the run-state of the Windows services on which StoreFront relies for correct operation, use the **Citrix Service Monitor** Windows service. This service has no other service dependencies and can monitor and report the failure of other critical StoreFront services. The monitor enables the relative health of a StoreFront server deployment to be determined externally by other Citrix components, such as NetScaler. Third party software can consume the StoreFront monitor XML response to monitor the health of essential StoreFront services.

After StoreFront is deployed, a default monitor that uses HTTP and port 8000 is created.

**Note:** Only a single instance of a monitor can exist within a Storefront deployment.

To make any changes to the existing default monitor, such as changing the protocol and port to HTTPS 443, use the three PowerShell cmdlets to view or reconfigure the StoreFront monitor service URL.

#### **Remove the default Service Monitor and replace it with one that uses HTTPS and port 443**

1. Open the PowerShell Integrated Scripting Environment (ISE) on the primary StoreFront server and run the following commands to change the default monitor to HTTPS 443.

```
$ServiceUrl = "https://localhost:443/StorefrontMonitor"
```

```
Set-STFServiceMonitor -ServiceUrl $ServiceUrl
```

```
Get-STFServiceMonitor
```

2. Once completed, propagate the changes to all other servers in the StoreFront server group.

3. To perform a quick test on the new monitor, enter the following URL into the browser on the StoreFront server or any other machine with network access to the StoreFront server. The browser should return an XML summary of the status of every Storefront service.

**https://<loadbalancingFQDN>:443/StoreFrontMonitor/GetSFServicesStatus**

This XML file does not appear to have any style information associated with it. The document tree is shown below.

```

## NetScaler Gateway and load balancing vServers on the same NetScaler appliance

If you have configured the NetScaler Gateway vServer and load balancing vServer on the same NetScaler appliance, internal domain users might experience issues when trying to access the StoreFront load balanced host base URL directly rather than passing through the NetScaler Gateway vServer.

In this scenario StoreFront assumes that the end user has already authenticated at the NetScaler Gateway because StoreFront correlates the source IP address of the incoming user with the NetScaler Gateway Subnet IP Address (SNIP). This triggers StoreFront attempt to use the AGBasic protocol to perform NetScaler Gateway silent authentication, rather than actually prompting the user to log on with their domain credentials. To avoid this issue, omit a SNIP address as shown below so that username and password authentication is used instead of AGBasic.

### Configure a Netscaler Gateway on the Storefront Server Group

### Loopback options when load balancing a StoreFront server group using NetScaler

In previous versions of Storefront such as 2.6 or older, Citrix recommended that you manually modify the hosts file on each StoreFront server to map the fully qualified domain name (FQDN) of the load balancer to the loopback address or the IP address of the specific StoreFront server. This ensures that Receiver for Web always communicates with the StoreFront services on the same server in a load balanced deployment. This is necessary because an HTTP session is created during the explicit login process between Receiver for Web and the authentication service and Receiver for Web communicates with Storefront services using the base FQDN. If the base FQDN were to resolve to the load balancer, the load balancer could potentially send the traffic to a different StoreFront server in the group, leading to authentication failure. This does not bypass the load balancer except when Receiver for Web attempts to contact the Store service residing on the same server as itself.

You can set loopback options using PowerShell. Enabling loopback negates the need to create host file entries on every StoreFront server in the server group.

Example Receiver for Web web.config file:

```
<communication attempts="2" timeout="00:01:00" loopback="On" loopbackPortUsingHttp="80">
```

Example PowerShell command:

```
& "c:\program files\Citrix\receiver storefront\scripts\ImportModules.ps1"
Set-DSLoopback -SiteId 1 -VirtualPath "/Citrix/StoreWeb" -Loopback "OnUsingHttp" -
LoopbackPortUsingHttp 81
```

The **-Loopback** parameter can take three possible values.

Value	Context
<b>On:</b> Changes the host of the URL to 127.0.0.1. The schema and port (if specified) are not changed.	Cannot be used if SSL-terminating load balancer is used.
<b>OnUsingHttp:</b> Changes the host to 127.0.0.1 and schema to HTTP and modifies the port the value configured for <b>loopbackPortUsingHttp</b> attribute.	Use only when the load balancer is SSL terminating. Communication between the load balancer and StoreFront servers is with HTTP. You can explicitly configure the HTTP port using the <b>-loopbackPortUsingHttp</b> attribute.
<b>Off:</b> The URL in the request is not modified in any way.	Use for trouble shooting. Tools like Fiddler cannot capture the traffic between Receiver for Web and StoreFront Services if loopback is set to "On".

---

## Configure NetScaler and StoreFront for Delegated Forms Authentication (DFA)

November 5, 2018

Extensible authentication provides a single customization point for extension of NetScaler's and StoreFront's form-based authentication. To achieve an authentication solution using the Extensible Authentication SDK, you must configure Delegated Form Authentication (DFA) between NetScaler and StoreFront. The Delegated Forms Authentication protocol allows generation and processing of authentication forms, including credential validation, to be delegated to another component. For example, NetScaler delegates its authentication to StoreFront, which then interacts with a third party authentication server or service.

### Installation recommendations

- To ensure communication between NetScaler and StoreFront is protected, use HTTPS instead of HTTP protocol.
- For cluster deployment, ensure that all the nodes have the same server certificate installed and configured in IIS HTTPS binding prior to configuration steps.
- Ensure that Netscaler has the issuer of StoreFront's server certificate as a trusted certificate authority when HTTPS is configured in StoreFront.

## StoreFront cluster installation considerations

- Install a third party authentication plugin on all the nodes prior to joining them up together.
- Configure all the Delegated Forms Authentication related settings on one node and propagate the changes to the others. See the “Enable Delegated Forms Authentication.”

## Enable Delegated Forms Authentication

Because there is no GUI to setup Citrix pre-shared key setting in StoreFront, use the PowerShell console to install Delegated Forms Authentication.

1. Install Delegated Forms Authentication. It is not installed by default and you need to install it using the PowerShell console.

```

1 PS C:\Users\administrator.PTD.000> cd 'C:\Program Files\Citrix\
  Receiver StoreFront\Scripts'
2 PS C:\Program Files\Citrix\Receiver StoreFront\Scripts> & .\
  ImportModules.ps1
3 Adding snapins
4 Importing modules
5 Loading 'C:\Program Files\Citrix\Receiver StoreFront\Admin\Citrix
  .DeliveryServices.ConfigurationProvider.dll'
6 Loading 'C:\Program Files\Citrix\Receiver StoreFront\Admin\Citrix
  .DeliveryServices.ConfigurationProvider.dll'
7
8 PS C:\Program Files\Citrix\Receiver StoreFront\Scripts> Install-
  DSDFAServer

30     FeatureClass            : Citrix.DeliveryServices.Framework
           .Feature.FeatureClass
31 <!--NeedCopy-->

```

2. Add Citrix Trusted Client. Configure the shared secret key (passphrase) between StoreFront and Netscaler. Your passphrase and client ID must be identical to what you configured in NetScaler.

```

1 PS C:\Program Files\Citrix\Receiver StoreFront\Scripts> Add-
  DSCitrixPSKTrustedClient -clientId netscaler.fqdn.com -
  passphrase secret
2 <!--NeedCopy-->

```

3. Set the Delegated Forms Authentication conversation factory to route all the traffic to the custom form. To find the conversation factory, look for ConversationFactory in C:\inetpub\wwwroot\Citrix\Authentication\web.config. This is an example of what you might see.

```

1 <example connectorURL="http://Example.connector.url:8080/adapters-
  sf-aaconnector-webapp">
2     <routeTable order="1000">
3         <routes>
4             <route name="StartExampleAuthentication" url="Example-
               Bridge-Forms/Start">
5                 <defaults>
6                     <add param="controller" value="
                       ExplicitFormsAuthentication" />
7                     <add param="action" value="AuthenticateStart" />
8                     <add param="postbackAction" value="Authenticate" />
9                     <add param="cancelAction" value="CancelAuthenticate"
                       />

```

```
10     <add param="conversationFactory" value="
        ExampleBridgeAuthentication" />
11     <add param="changePasswordAction" value="
        StartChangePassword" />
12     <add param="changePasswordController" value="
        ChangePassword" />
13     <add param="protocol" value="CustomForms" />
14     </defaults>
15 </route>
16 <!--NeedCopy-->
```

4. In PowerShell, set the Delegated Forms Authentication conversation factory. In this example, to ExampleBridgeAuthentication.

```
1 PS C:\Program Files\Citrix\Receiver StoreFront\Scripts> Set-
    DSDFAProperty -ConversationFactory ExampleBridgeAuthentication
2 <!--NeedCopy-->
```

PowerShell arguments are not case-sensitive: -ConversationFactory is identical to -conversationfactory.

## Uninstall StoreFront

Before you uninstall StoreFront, uninstall any third party authentication plugin, as it will impact the functionality of StoreFront.

## Authenticate using different domains

March 29, 2019

Some organizations have policies in place that do not allow you to give third-party developers or contractors access to published resources in a production environment. This article shows you how to give access to published resources in a test environment by authenticating through NetScaler Gateway with one domain. You can then use a different domain to authenticate to StoreFront and the Receiver for Web site. Authentication through NetScaler Gateway described in this article is supported for users logging on through the Receiver for Web site. This authentication method is not supported for users of native desktop or mobile Citrix Receivers.

### Set up a test environment

This example uses a production domain called `production.com` and a test domain called `development.com`.

### **production.com domain**

The `production.com` domain in this example is set up as follows:

- NetScaler Gateway with `production.com` LDAP authentication policy configured.
- Authentication through the gateway occurs using a `production\testuser1` account and password.

### **development.com domain**

The `development.com` domain in this example is set up as follows:

- StoreFront, XenApp and XenDesktop 7.0 or higher and VDAs are all on the `development.com` domain.
- Authentication to the Citrix Receiver for Web site occurs using a `development\testuser1` account and password.
- There is no trust relationship between the two domains.

## **Configure a NetScaler Gateway for the store**

To configure a NetScaler Gateway for the store:

1. Select **Stores** in the left pane of the Citrix StoreFront management console, and in the **Actions** pane, click **Manage NetScaler Gateways**.
2. On the Manage NetScaler Gateways screen, click the **Add** button.
3. Complete the General Settings, Secure Ticket Authority, and Authentication steps.

Add NetScaler Gateway Appliance

### StoreFront

- General Settings**
- Secure Ticket Authority
- Authentication Settings
- Summary

#### General Settings

Complete these settings to configure access to stores through NetScaler Gateway for users connecting from public networks. Remote access through a NetScaler Gateway cannot be applied to unauthenticated stores.

Display name:

NetScaler Gateway URL:

Usage or role: 

Add NetScaler Gateway Appliance

### StoreFront

- General Settings
- Secure Ticket Authority**
- Authentication Settings
- Summary

#### Secure Ticket Authority (STA)

STA is hosted on XenDesktop, XenApp, and VDI-in-a-Box servers and issues session tickets in response to connection requests. These session tickets form the basis of authentication and authorization for access to XenDesktop, XenApp, and VDI-in-a-Box resources.

Secure Ticket Authority URLs: ⓘ

https://sta1.development.com/scripts/ctxsta.dll	▲
https://sta2.development.com/scripts/ctxsta.dll	▼

Load balance multiple STA servers

Bypass failed STA for:  hours  minutes  seconds

Enable session reliability ⓘ

Request tickets from two STAs, where available ⓘ

Edit NetScaler Gateway appliance - ProductionGateway

The screenshot shows the 'Authentication Settings' configuration page in the StoreFront management console. On the left, a navigation pane lists 'General Settings', 'Secure Ticket Authority', and 'Authentication Settings' (which is highlighted with a blue arrow). The main area is titled 'Authentication Settings' and contains the following fields:

- Version:** A dropdown menu set to '10.0 (Build 69.4) or later'.
- VServer IP address: (optional):** An empty text input field.
- Logon type:** A dropdown menu set to 'Domain'.
- Smart card fallback:** A dropdown menu set to 'None'.
- Callback URL: (optional):** A text input field containing 'https://callback.production.com', followed by the path '/CitrixAuthService/AuthService.asmx'.

At the bottom right of the configuration area, there are three buttons: 'OK', 'Cancel', and 'Apply'.

**Note**

DNS conditional forwarders may need to be added so that the DNS servers in use on both domains can resolve FQDNs on the other domain. The NetScaler must be able to resolve the STA server FQDNs on the `development.com` domain using its `production.com` DNS server. StoreFront should also be able to resolve the callback URL on the `production.com` domain using its `development.com` DNS server. Alternatively, a `development.com` FQDN can be used which resolves to the NetScaler Gateway vServer virtual IP (VIP).

**Enable pass-through from NetScaler Gateway**

1. Select **Stores** in the left pane of the Citrix StoreFront management console, and in the **Actions** pane, click **Manage Authentication Methods**.
2. On the Manage Authentication Methods screen, select **Pass-through from NetScaler Gateway**.
3. Click **OK**.

## Manage Authentication Methods - Store

Select the methods which users will use to authenticate and access resources. 

	Method	Settings
<input checked="" type="checkbox"/>	User name and password	 ▼
<input type="checkbox"/>	SAML Authentication	 ▼
<input type="checkbox"/>	Domain pass-through Can be enabled / disabled separately on Receiver for Web sites	
<input type="checkbox"/>	Smart card Can be enabled / disabled separately on Receiver for Web sites	
<input type="checkbox"/>	HTTP Basic	
<input checked="" type="checkbox"/>	Pass-through from NetScaler Gateway	 ▼

Installing and uninstalling the authentication methods and the authentication service settings are included in the advanced options. 

OK

Cancel

**Configure the store for remote access using the Gateway**

1. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Configure Remote Access Settings**.
2. Select **Enable Remote Access**.
3. Ensure that you have registered the NetScaler Gateway with your store. If you do not register the NetScaler Gateway, the STA ticketing will not work.

## Configure Remote Access Settings - Store

Enabling remote access allows users outside the firewall to securely access resources. After you enable remote access, add a NetScaler Gateway appliance.

Enable Remote Access

Select the permitted level of access to internal resources

Allow users to access only resources delivered through StoreFront (No VPN tunnel) i

Allow users to access all resources on the internal network (Full VPN tunnel) i

Users may require the NetScaler Gateway Plug-in to establish a full VPN tunnel.

NetScaler Gateway appliances:

ProductionGateway i

Add...

Default appliance:

ProductionGateway ▼

OK

Cancel

### Disable token consistency

1. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the results pane, select a store. In the **Actions** pane, click **Configure Store Settings**.
2. On the Configure Store Settings page, select **Advanced Settings**.
3. Clear the **Require token consistency** check box. For more information, see [Advanced store settings](#).
4. Click **OK**.

## Configure Store Settings - Store

**StoreFront**

- User Subscriptions
- Kerberos Delegation
- Optimal HDX Routing
- Citrix Online Integration
- Advertise Store
- Advanced Settings**

**Advanced Settings**

Configure advanced settings with caution.

Communication timeout duration	30
Connection timeout	6
Enable enhanced enumeration	<input checked="" type="checkbox"/>
Enable socket pooling	<input type="checkbox"/>
Filter resources by excluded keywords	
Filter resources by included keywords	
Filter resources by type	
Maximum concurrent enumerations	0
Minimum farms for concurrent enumeration	3
Override ICA client name	<input type="checkbox"/>
<b>Require token consistency</b>	<input checked="" type="checkbox"/>
Server communication attempts	1
Show Desktop Viewer for legacy clients	<input type="checkbox"/>

**Require token consistency**  
When enabled, StoreFront enforces consistency between the gateway used to authenticate and the gateway used to access the store. When the values are inconsistent, users must reauthenticate. Must be enabled for Smart Access. Default: On

OK Cancel Apply

**Note**

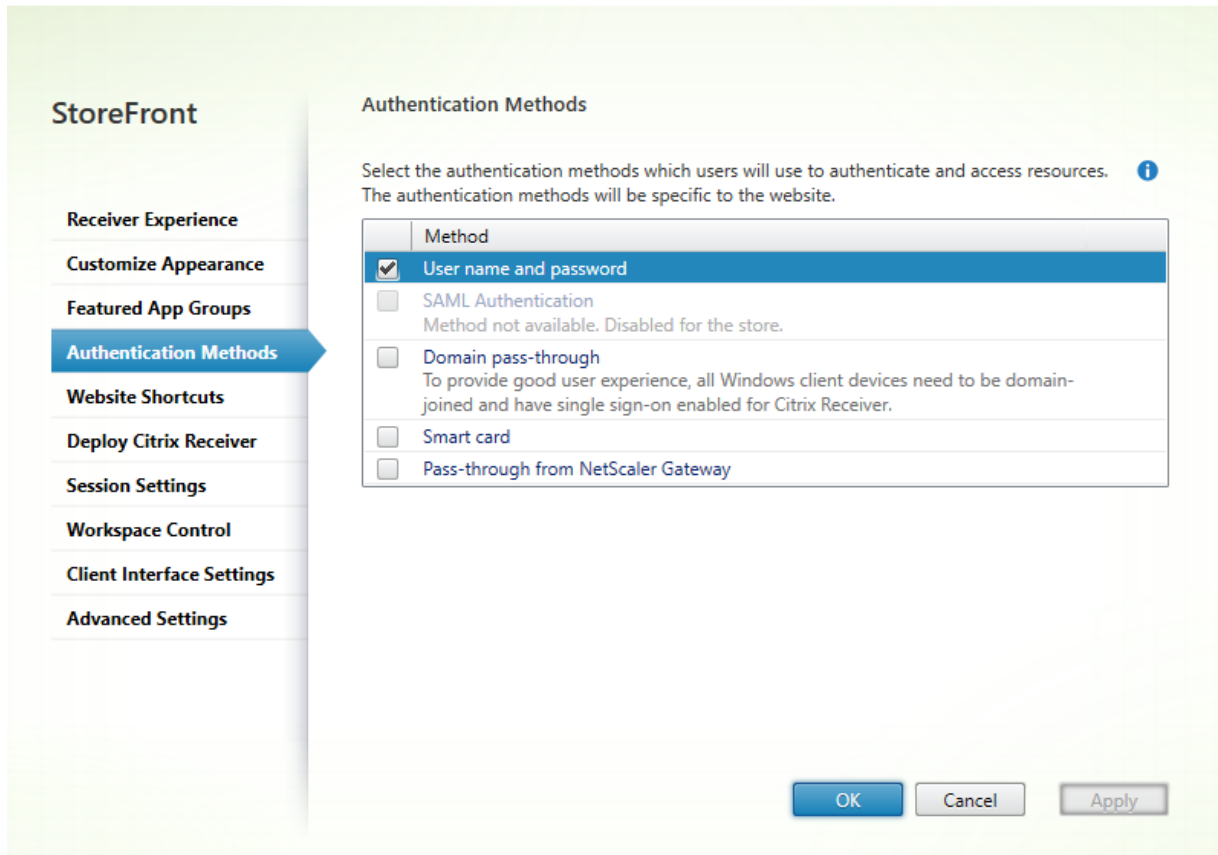

The Require token consistency setting is selected (on) by default. If you disable this setting, SmartAccess features used for NetScaler End Point Analysis (EPA) stop working. For more information on SmartAccess, see [CTX138110](#).

**Disable pass-through from NetScaler Gateway for the Receiver for Web site****Important**

Disabling pass-through from NetScaler Gateway prevents Receiver for Web from trying to use the incorrect credentials from the `production.com` domain passed from NetScaler. Disabling pass-through from NetScaler Gateway causes Receiver for Web to prompt the user to enter credentials. These credentials are different from the credentials used to log on through the NetScaler Gateway.

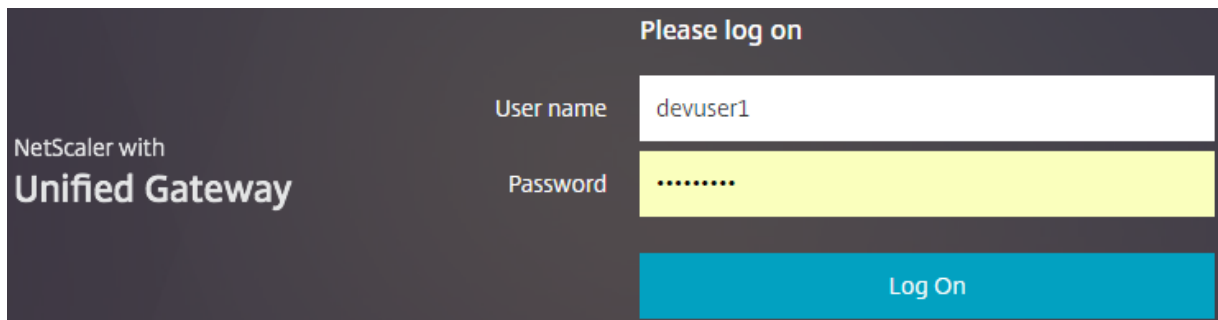

1. Select the **Stores** node in the left pane of the Citrix StoreFront management console.
2. Select the **store** that you want to modify.
3. In the **Actions** pane, click **Manage Receiver for Web Sites**.
4. In Authentication Methods, clear the Pass-through from NetScaler Gateway check box.
5. Click **OK**.

### Log on to Gateway using a production.com user and credentials

To test, log on to Gateway using a production.com user and credentials.

After logon, the user is prompted to enter development.com credentials.

## Add a trusted domain drop-down list in StoreFront (optional)

This setting is optional, but it may help prevent the user from accidentally entering the wrong domain to authenticate through the NetScaler Gateway.

If the user name is the same for both domains, entering the wrong domain is more likely. New users may also be used to leaving out the domain when they log on through the NetScaler Gateway. Users may then forget to enter domain\username for the second domain when they are prompted to log on to the Receiver for Web site.

1. Select **Stores** in the left pane of the Citrix StoreFront management console, and in the **Actions** pane, click **Manage Authentication Methods**.
2. Select the drop-down arrow next to **User name and password**.
3. Click **Add** to add `development.com` as a trusted domain, and select the **Show domains list in logon page** check box.
4. Click **OK**.

### Configure Trusted Domains

Allow users to log on from:  Any domain  
 Trusted domains only

Trusted domains:

Default domain:

Show domains list in logon page

**CITRIX**  
StoreFront

User name:

Password:

Domain:

**Note**

Browser password caching is not recommended in this authentication scenario. If users have different passwords for the two different domain accounts, password caching can lead to a poor experience.

**NetScaler clientless VPN (CVPN) session action policy**

- If Single Sign-on to web applications is enabled within your NetScaler session policy, incorrect credentials sent by NetScaler to Receiver for Web are ignored because you disabled the **Pass-through from NetScaler Gateway** authentication method on the Receiver for Web site. Receiver for Web prompts for credentials regardless of what this option is set to.
- Populating the Single Sign-on entries in the Client Experience and Published App tabs in NetScaler does not change the behavior described in this article.

## Configure beacon points

October 25, 2018

Use the Manage Beacons task to specify URLs inside and outside your internal network to be used as beacon points. Citrix Receiver attempts to contact beacon points and uses the responses to determine whether users are connected to local or public networks. When a user accesses a desktop or application, the location information is passed to the server providing the resource so that appropriate connection details can be returned to Citrix Receiver. This ensures that users are not prompted to log on again when they access a desktop or application.

For example, if the internal beacon point is accessible, this indicates that the user is connected to the local network. However, if Citrix Receiver cannot contact the internal beacon point and receives responses from both the external beacon points, this means that the user has an Internet connection but is outside the corporate network. Therefore, the user must connect to desktops and applications through NetScaler Gateway. When the user accesses a desktop or application, the server providing the resource is notified to provide details of the NetScaler Gateway appliance through which the connection must be routed. This means that the user does not need to log on to the appliance when accessing the desktop or application.

By default, StoreFront uses the server URL or load-balanced URL of your deployment as the internal beacon point. The Citrix website and the virtual server or user logon point (for Access Gateway 5.0) URL of the first NetScaler Gateway deployment you add are used as external beacon points by default.

If you change any beacon points, ensure that users update Citrix Receiver with the modified beacon information. Where a Receiver for Web site is configured for a store, users can obtain an updated Citrix Receiver provisioning file from the site. Otherwise, you can [export a provisioning file](#) for the store and make this file available to your users.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. On the Windows Start screen or Apps screen, locate and click the Citrix StoreFront tile.
2. Select the **Stores** node in the left pane of the Citrix StoreFront management console and, in the Actions pane, click Manage Beacons.
3. Specify the URL to use as the internal beacon point.
  - To use the server URL or load-balanced URL of your StoreFront deployment, select Use the service URL.
  - To use an alternative URL, select Specify beacon address and enter a highly available URL within your internal network.
4. Click Add to enter the URL of an external beacon point. To modify a beacon point, select the URL in the External beacons list and click Edit. Select a URL in the list and click Remove to stop using that address as a beacon point.

You must specify at least two highly available external beacon points that can be resolved from public networks. The beacon URLs should be fully qualified domain names (<http://example.com>) and not the abbreviated NetBIOS name (<http://example>). This enables Citrix Receiver to determine whether users are located behind an Internet paywall, such as in a hotel or Internet café. In such cases, all the external beacon points connect to the same proxy.

## Advanced configurations

October 15, 2018

StoreFront allows advanced options that you can configure using the StoreFront console, PowerShell, certificate properties, or configuration files.

---

<a href="#">Configure Desktop Appliance sites</a>	Create, remove, and modify Desktop Appliance sites.
<a href="#">Create a single Fully Qualified Domain Name (FQDN) to access a store internally and externally</a>	Provide access to resources from within your corporate network and from the Internet through a NetScaler Gateway and simplify the user experience by creating a single FQDN for both internal and roaming external clients.
<a href="#">Configure Resource Filtering</a>	Filter enumeration resources based on resource type and keywords.

---

## Configure Desktop Appliance sites

February 25, 2021

The tasks below describe how to create, remove, and modify Desktop Appliance sites. To create or remove sites, you execute Windows PowerShell commands. Changes to Desktop Appliance site settings are made by editing the site configuration files.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

Note: The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront admin console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of PowerShell before opening the StoreFront console.

## To create or remove Desktop Appliance sites

Only a single store can be accessed through each Desktop Appliance site. You can create a store containing all the resources you want to make available to users with non-domain-joined desktop appliances. Alternatively, create separate stores, each with a Desktop Appliance site, and configure your users' desktop appliances to connect to the appropriate site.

1. Use an account with local administrator permissions to start Windows PowerShell and, at a command prompt, type the following command to import the StoreFront modules.

```
1 & "installationlocation\Scripts\ImportModules.ps1"
2 <!--NeedCopy-->
```

Where `installationlocation` is the directory in which StoreFront is installed, typically `C:\Program Files\Citrix\Receiver StoreFront\`.

2. To create a new Desktop Appliance site, type the following command.

```
1 Install-DSDesktopAppliance -FriendlyName sitename -SiteId iisid
2   -VirtualPath sitepath -UseHttps {
3     $False | $True }
4
5   -StoreUrl storeaddress [-EnableMultiDesktop {
6     $False | $True }
7   ]
8   [-EnableExplicit {
9     $True | $False }
10  ] [-EnableSmartCard {
11    $False | $True }
12  ]
13  [-EnableEmbeddedSmartCardSSO {
14    $False | $True }
15  ]
16 <!--NeedCopy-->
```

Where `sitename` is a name that helps you to identify your Desktop Appliance site. For `iisid`, specify the numerical ID of the Microsoft Internet Information Services (IIS) site hosting StoreFront, which can be obtained from the Internet Information Services (IIS) Manager console. Replace `sitepath` with the relative path at which the site should be created in IIS, for example, `/Citrix/DesktopAppliance`. Note that Desktop Appliance site URLs are case sensitive.

Indicate whether StoreFront is configured for HTTPS by setting `-UseHttps` to the appropriate value.

To specify the absolute URL of the store service used by the Desktop Appliance Connector site, use `StoreUrl storeaddress`. This value is displayed for the Store summary in the administration

console.

By default, when a user logs on to a Desktop Appliance site, the first desktop available to the user starts automatically. To configure your new Desktop Appliance site to enable users to choose between multiple desktops, if available, set `-EnableMultiDesktop` to `$True`.

Explicit authentication is enabled by default for new sites. You can disable explicit authentication by setting the `-EnableExplicit` argument to `$False`. Enable smart card authentication by setting `-EnableSmartCard` to `$True`. To enable pass-through with smart card authentication, you must set both `-EnableSmartCard` and `-EnableEmbeddedSmartCardSSO` to `$True`. If you enable explicit and either smart card or pass-through with smart card authentication, users are initially prompted to log on with a smart card, but can fall back to explicit authentication if they experience any issues with their smart cards.

The optional arguments configure settings that can also be modified after the Desktop Appliance site has been created by editing the site configuration file.

**Example:**

Create a Desktop Appliance Connector site at virtual path `/Citrix/DesktopAppliance1` in the default IIS web site.

```
1 Install-DSDesktopAppliance `
2
3 \-FriendlyName DesktopAppliance1 `
4
5 \-SiteId 1 `
6
7 \-VirtualPath /Citrix/DesktopAppliance1 `
8
9 \-UseHttps $false `
10
11 \-StoreUrl https://serverName/Citrix/Store `
12
13 \-EnableMultiDesktop $true `
14
15 \-EnableExplicit $true `
16
17 \-EnableSmartCard $true `
18
19 \-EnableEmbeddedSmartCardSSO $false
```

3. To remove an existing Desktop Appliance site, type the following command.

```
1 Remove-DSDesktopAppliance -SiteId iisid -VirtualPath sitepath
2 <!--NeedCopy-->
```

Where `iisid` is the numerical ID of the IIS site hosting StoreFront and `sitepath` is the relative path of the Desktop Appliance site in IIS, for example, `/Citrix/DesktopAppliance`.

4. To list the Desktop Appliance sites currently available from your StoreFront deployment, type the following command.

```
1 Get-DSDesktopAppliancesSummary
2 <!--NeedCopy-->
```

## To configure user authentication

Desktop Appliance sites support explicit, smart card, and pass-through with smart card authentication. Explicit authentication is enabled by default. If you enable explicit and either smart card or pass-through with smart card authentication, the default behavior initially prompts users to log on with a smart card. Users who experience issues with their smart cards are given the option of entering explicit credentials. If you configure IIS to require client certificates for HTTPS connections to all StoreFront URLs, users cannot fall back to explicit authentication if they cannot use their smart cards. To configure the authentication methods for a Desktop Appliance site, you edit the site configuration file.

1. Use a text editor to open the `web.config` file for the Desktop Appliance site, which is typically located in the `C:\inetpub\wwwroot\Citrix\storenameDesktopAppliance` directory, where `storename` is the name specified for the store when it was created.

2. Locate the following element in the file.

```
1 <explicitForms enabled="true" />
2 <!--NeedCopy-->
```

3. Change the value of the `enabled` attribute to `false` to disable explicit authentication for the site.

4. Locate the following element in the file.

```
1 <certificate enabled="false" useEmbeddedSmartcardSso="false"
2     embeddedSmartcardSsoPinTimeout="00:00:20" />
3 <!--NeedCopy-->
```

5. Set the value of the `enabled` attribute to `true` to enable smart card authentication. To enable pass-through with smart card authentication, you must also set the value of the `useEmbeddedSmartcardSso` attribute to `true`. Use the `embeddedSmartcardSsoPinTimeout` attribute to set the time in hours, minutes, and seconds for which the PIN entry screen is displayed before it times out. When the PIN entry screen times out, users are returned to the logon screen and must remove and reinsert their smart cards to access the PIN entry screen again. The time-out period is set to 20 seconds by default.

## To enable users to choose between multiple desktops

By default, when a user logs on to a Desktop Appliance site, the first desktop (in alphabetical order) available to the user in the store for which the site is configured starts automatically. If you provide users with access to multiple desktops in a store, you can configure the Desktop Appliance site to display the available desktops so users can choose which one to access. To change these settings, you edit the site configuration file.

1. Use a text editor to open the web.config file for the Desktop Appliance site, which is typically located in the C:\inetpub\wwwroot\Citrix\storenameDesktopAppliance directory, where store-name is the name specified for the store when it was created.
2. Locate the following element in the file.

```
1 <resources showMultiDesktop="false" />
2 <!--NeedCopy-->
```

3. Change the value of the showMultiDesktop attribute to true to enable users to see and select from all the desktops available to them in the store when they log on to the Desktop Appliance site.

## Create a single Fully Qualified Domain Name (FQDN) to access a store internally and externally

October 25, 2018

Note: To use this feature with native desktop receivers, the following versions are required.

- Windows Receiver 4.2
- MAC Receiver 11.9

You can provide access to resources from within your corporate network and from the Internet through a NetScaler Gateway and simplify the user experience by creating a single FQDN for both internal and roaming external clients.

Creating a single FQDN is helpful to users who configure any of the native Receivers. They need remember only a single URL whether they are currently connected to an internal or public network.

### StoreFront beacons for native Receivers

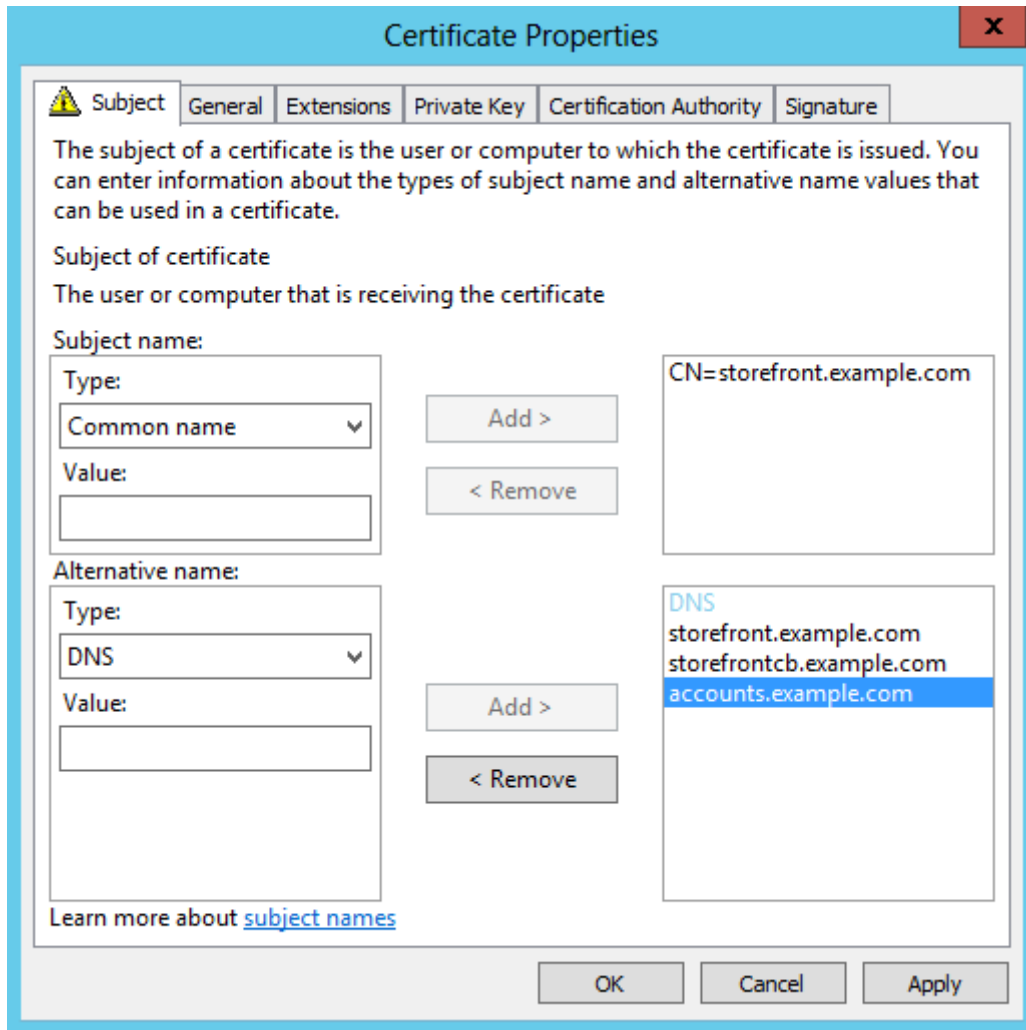

Citrix Receiver attempts to contact beacon points and uses the responses to determine whether users are connected to local or public networks. When a user accesses a desktop or application, the location information is passed to the server providing the resource so that appropriate connection details

can be returned to Citrix Receiver. This ensures that users are not prompted to log on again when they access a desktop or application. For information about configuring beacon points, see [Configure beacon points](#).

### **Configure the NetScaler Gateway vServer and SSL Certificate**

The shared FQDN resolves either to an external firewall router interface IP or NetScaler Gateway vServer IP in the DMZ when external clients try to access resources from outside of the corporate network. Ensure the Common Name and Subject Alternative Name fields of the SSL certificate contain the shared FQDN to be used to access the store externally. By using a third party root CA such as Verisign instead of an enterprise Certification Authority (CA) to sign the gateway certificate, any external client automatically trusts the certificate bound to the gateway vServer. If you use a third party root CA such as Verisign, no additional root CA certificates need to be imported on to external clients.

To deploy a single certificate with the Common Name of the shared FQDN to both the NetScaler Gateway and the StoreFront server, consider whether you want to support remote discovery. If so, make sure the certificate follows the specification for the Subject Alternative Names.

### NetScaler Gateway vServer example certificate: storefront.example.com

1. Ensure that the shared FQDN, the callback URL, and the accounts alias URL are included in the DNS field as Subject Alternative Name (SANs).
2. Ensure that the private key is exportable so the certificate and key can be imported into the NetScaler Gateway.
3. Ensure that Default Authorization is set to Allow.
4. Sign the certificate using a third party CA such as Verisign or an enterprise root CA for your organization.

### Two-node server group example SANs:

storefront.example.com (mandatory)

storefrontcb.example.com (mandatory)

accounts.example.com (mandatory)

`storefrontserver1.example.com` (optional)

`storefrontserver2.example.com` (optional)

### **Sign the Netscaler Gateway vServer SSL certificate using a Certification Authority (CA)**

Based on your requirements, you have two options for choosing the type of CA signed certificate.

- Option 1 - Third Party CA signed certificate: If the certificate bound to the Netscaler Gateway vServer is signed by a trusted third party, external clients will likely NOT need any root CA certificates copied to the their trusted root CA certificate stores. Windows clients ship with the root CA certificates of the most common signing agencies. Examples of commercial third party CAs that could be used include DigiCert, Thawte, and Verisign. Note that mobile devices such as iPads, iPhones, and Android tablets and phones might still require the root CA to be copied onto the device to trust the NetScaler Gateway vServer.
- Option 2 - Enterprise Root CA signed certificate: If you choose this option, every external client requires the enterprise root CA certificate copied to their trusted root CA stores. If using portable devices with native Receiver installed, such as iPhones and iPads, create a security profile on these devices.

### **Import the root certificate into portable devices**

- iOS devices can import .CER x.509 certificate files using email attachments, because accessing the local storage of iOS devices is usually not possible.
- Android devices require the same .CER x.509 format. The certificate can be imported from the device local storage or email attachments.

### **External DNS: `storefront.example.com`**

Ensure that the DNS resolution provided by your organization's Internet service provider resolves to the externally facing IP of the firewall router on the outside edge of DMZ or to the NetScaler Gateway vServer VIP.

### **Split view DNS**

- When split-view DNS is correctly configured, the source address of the DNS request should send the client to the correct DNS A record.
- When clients roam between public and corporate networks, their IP should change. Depending on the network to which they are currently connected, they should receive the correct A record when they query `storefront.example.com`.

### **Import certificates issued from a Windows CA to NetScaler Gateway**

WinSCP is a useful and free third party tool to move files from a Windows machine to a NetScaler Gateway file system. Copy certificates for import to the `/nsconfig/ssl/` folder within the NetScaler Gateway file system. You can use the OpenSSL tools on the NetScaler Gateway to extract the certificate and

key from a PKCS12/PFX file to create two separate .CER and .KEY X.509 files in PEM format that can be used by the NetScaler Gateway

1. Copy the PFX file into /nsconfig/ssl on the NetScaler Gateway appliance or VPX.
2. Open the NetScaler Gateway command line interface.
3. To switch to the FreeBSD shell, type Shell to exit the NetScaler Gateway command line interface.
4. To change directory, use cd /nsconfig/ssl.
5. Run openssl pkcs12 -in <imported cert file>.pfx -nokeys -out <certfilename>.cer and enter the PFX password when prompted.
6. Run openssl pkcs12 -in <imported cert file>.pfx -nocerts -out <keyfilename>.key
7. Enter the PFX password when prompted and then set a private key PEM passphrase to protect the .KEY file.
8. To ensure that the .CER and .KEY files were successfully created inside /nsconfig/ssl/, run ls -al.
9. To return to the NetScaler Gateway command line interface, type Exit.

### **Native Windows/Mac Receiver Gateway session policy**

REQ.HTTP.HEADER User-Agent CONTAINS CitrixReceiver && REQ.HTTP.HEADER X-Citrix-Gateway EXISTS

### **Receiver for Web Gateway session policy**

REQ.HTTP.HEADER User-Agent NOTCONTAINS CitrixReceiver && REQ.HTTP.HEADER Referer EXISTS

### **cVPN and Smart Access Settings**

If you use SmartAccess, enable smart access mode on the NetScaler Gateway vServer properties page. Universal Licenses are required for every concurrent user who accesses remote resources.

### Configure the StoreFront server host base URL, gateway, and SSL certificate

The same shared FQDN that resolves to the NetScaler Gateway vServer should also resolve directly to the StoreFront load balancer, if a StoreFront cluster was created or a single StoreFront IP that hosts the store.

#### Internal DNS: Create three DNS A records.

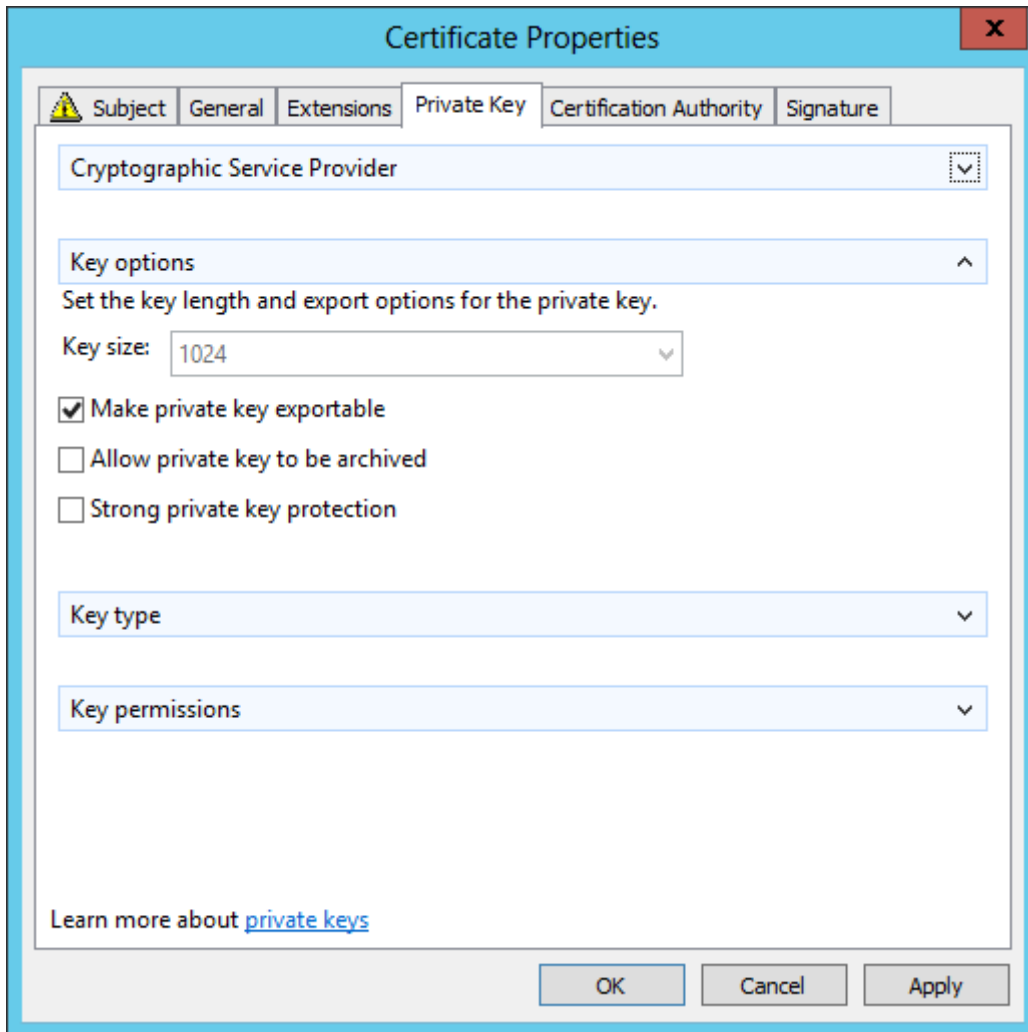

- `storefront.example.com` should resolve to the storefront load balancer or single StoreFront server IP.
- `storefrontcb.example.com` should resolve to the gateway vServer VIP so if a firewall exists between the DMZ and the enterprise local network, allow for this.
- `accounts.example.com` — create as a DNS alias for `storefront.example.com`. It also resolves to the load balancer IP for the StoreFront cluster or a single StoreFront server IP.

#### StoreFront server example certificate: `storefront.example.com`

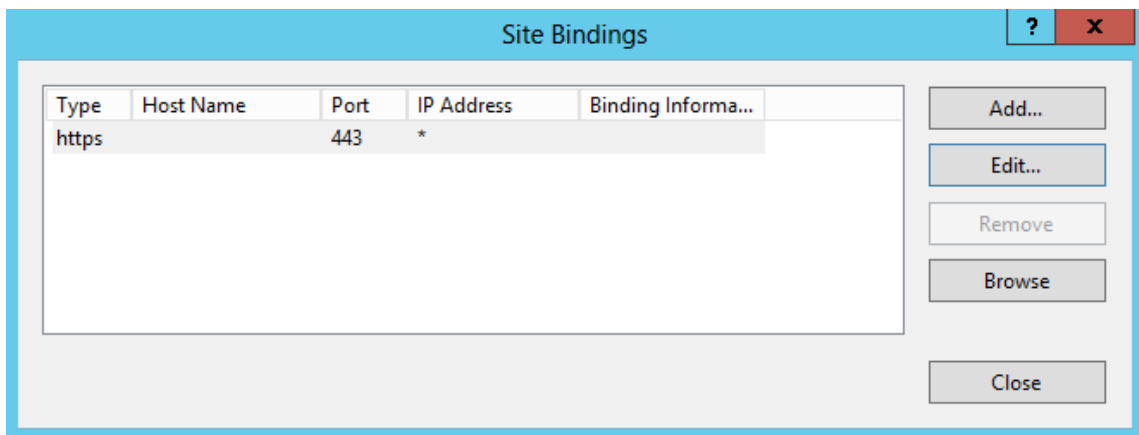

1. Create a suitable certificate for the StoreFront server or server group before installing StoreFront.
2. Add the shared FQDN to the Common name and DNS fields. Ensure this matches the FQDN used in the SSL certificate bound to the NetScaler Gateway vServer that you created earlier or use the same certificate bound to the NetScaler Gateway vServer.
3. Add the accounts alias (`accounts.example.com`) as another SAN to the certificate. Note that the accounts alias used in the SAN is the one used in the Netscaler Gateway Session Profile in the earlier procedure - **Native Receiver Gateway session policy and profile**.

4. Ensure that the private key is exportable so the certificate can be transferred to another server or to multiple StoreFront server group nodes.

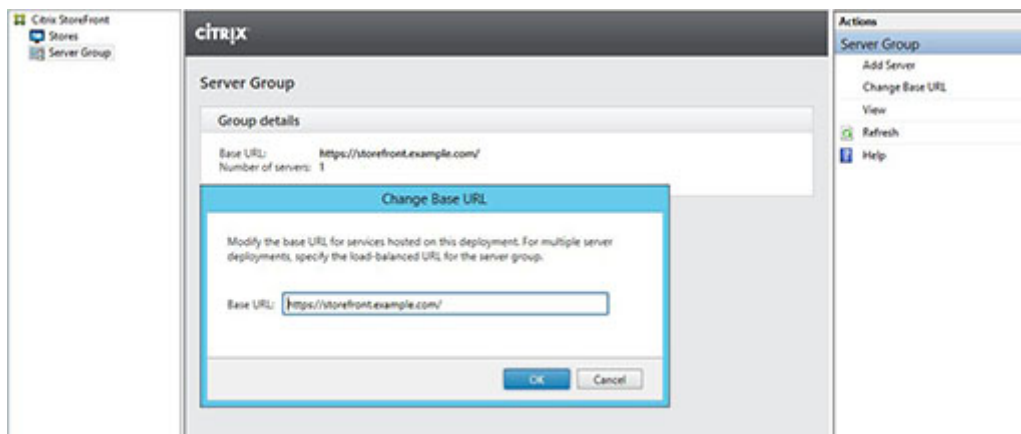

5. Sign the certificate using a third party CA such as VeriSign, your enterprise root CA, or intermediate CA.
6. Export the certificate in PFX format including the private key.
7. Import the certificate and private key into the StoreFront server. If deploying a Windows NLB StoreFront cluster, import the certificate into every node. If using an alternative load balancer such as a Netscaler LB vServer, import the certificate there instead.
8. Create an HTTPS binding in IIS on the StoreFront server and bind the imported SSL certificate to it.

- Configure the host base URL on the StoreFront server to match the already chosen shared FQDN.

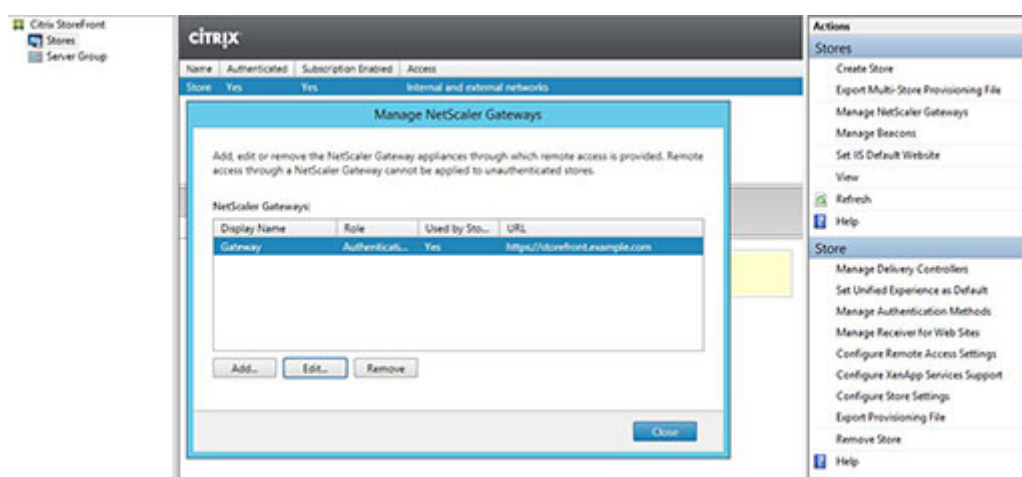

**Note:** StoreFront always auto selects the last Subject Alternative Name in the list of SANs within the certificate. This is merely a suggested host base URL to assist StoreFront administrators and is usually correct. You can manually set it to any valid HTTPS://<FQDN> provided it exists within the certificate as a SAN. Example: <https://storefront.example.com>

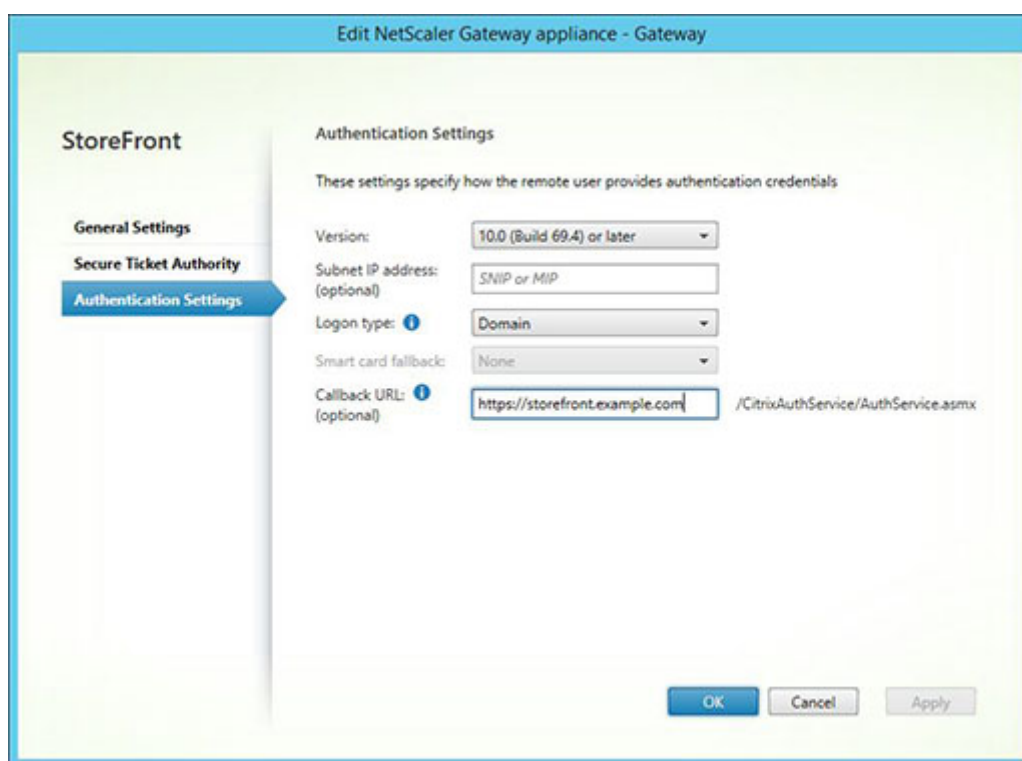

### Configure the Gateway on the StoreFront server: [storefront.example.com](https://storefront.example.com)

- From the **Stores** node, click on **Manage NetScaler Gateways** in the **Actions** pane.
- Select the **Gateway** from the list and click **Edit**.

3. On the **General Settings** page, type the shared FQDN in the **NetScaler Gateway URL** field.
4. Select the **Authentication Settings** tab and type the callback FQDN into the **Callback URL** field.

5. Select the **Secure Ticket Authority** tab and ensure that the Secure Ticket Authority (STA) servers match the list of delivery controllers already configured within the **Store** node.
6. Enable remote access for the store.
7. Manually set the internal beacon to the accounts alias (`accounts.example.com`) and it must not be resolvable from outside the gateway. This FQDN must be distinct from the external beacon that is shared by the StoreFront hostbase URL and NetScaler Gateway vServer (`storefront.example.com`). DO NOT use the shared FQDN, as this creates a situation where both the internal and external

beacons are identical.

8. Note that if you want to support discovery using FQDNs, follow these steps. If the provisioning file configuration is enough or if you are using only Receiver for Web, you can skip the following steps.

Add an additional `<allowedAudiences>` entry in `C:\inetpub\wwwroot\Citrix\Authentication\web.config`. There are two `<allowedAudiences>` entries in the authentication `web.config` file. Only the first entry in the file for the Authentication Token Producer requires you to add an additional `<allowedAudience>`.

9. Perform a search for the `<allowedAudiences>` string. Locate the following entry below and add the line shown in **bold**, save, and close the `web.config` file.

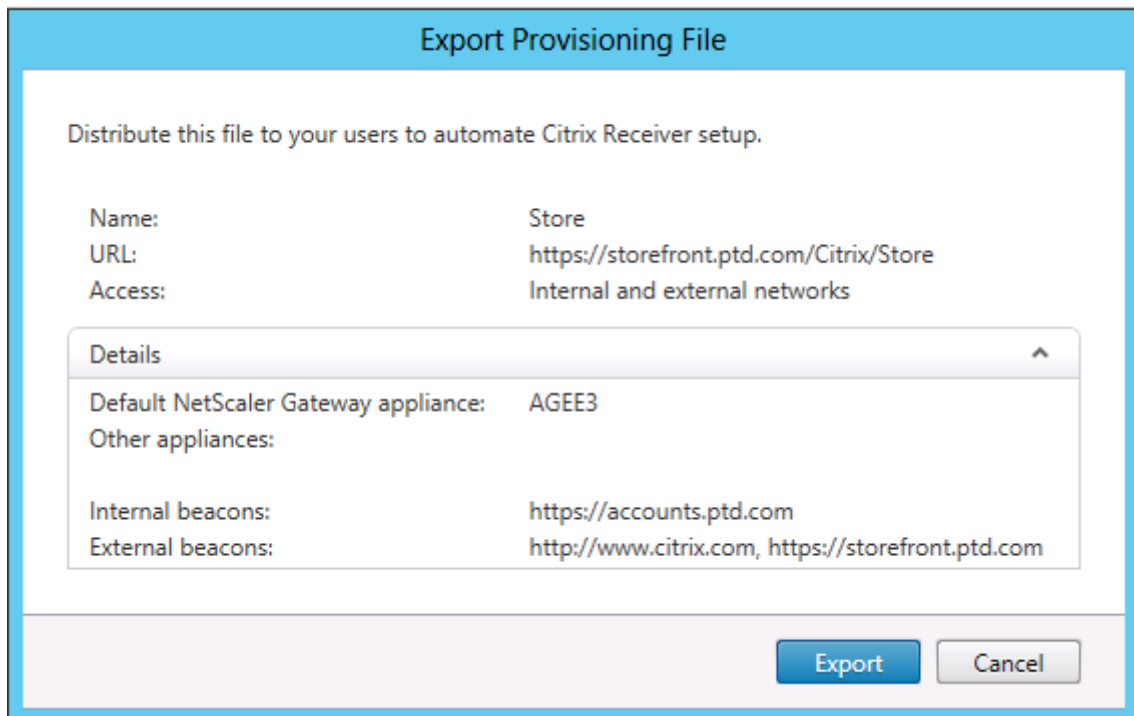

```
<service id="abd6f54b-7d1c-4a1b-a8d7-14804e6c8c64" displayName="Authentication Token Producer">
.....
.....
<allowedAudiences>
<add name="https-storefront.example.com" audience="https://storefront.example.com/" />
** <add name="https-accounts.example.com" audience="https://accounts.example.com/" />**
</allowedAudiences>
```

9. In **C:\inetpub\wwwroot\Citrix\Roaming\web.config**. Locate the following entry below and add the line shown in **bold**, save, and close the web.config file.

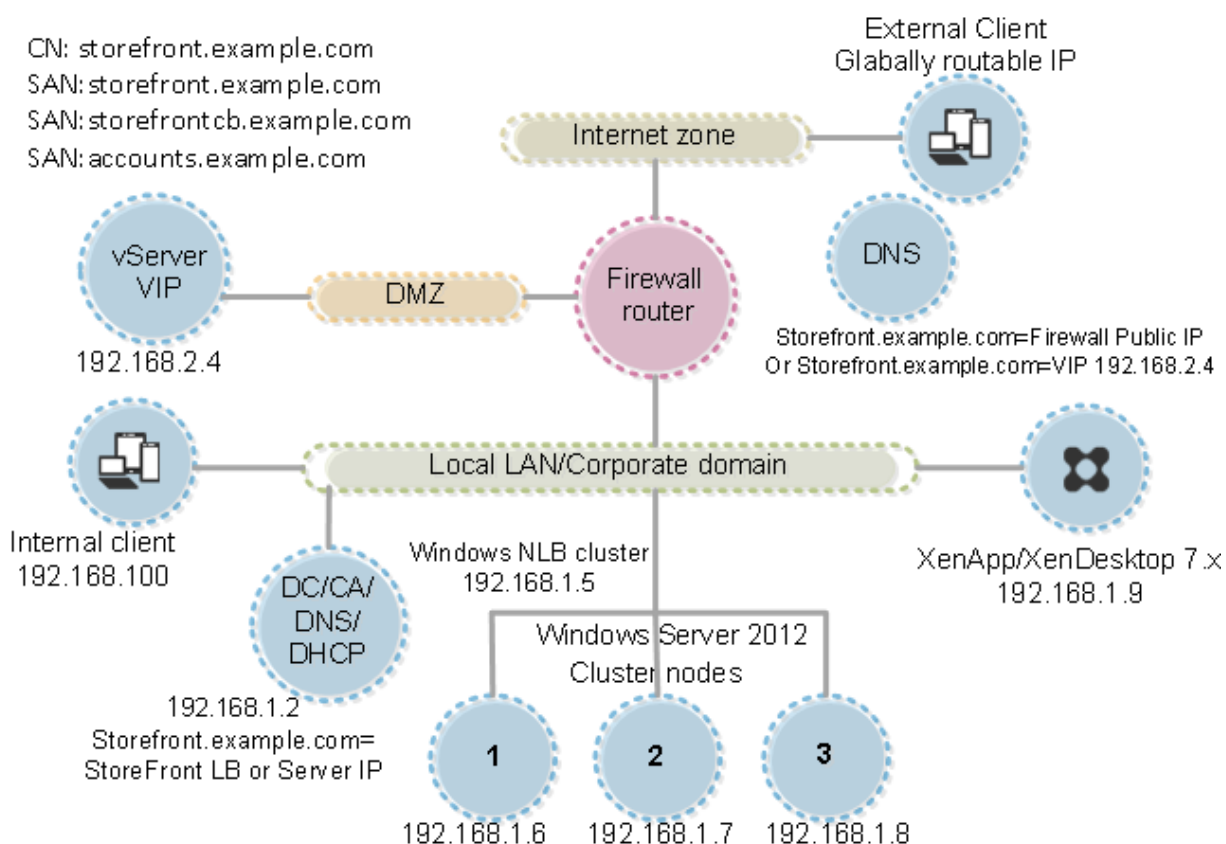

```
<tokenManager>
<services>
<clear />
.....
.....
```

```
1         \</trustedIssuers\>
2         \<allowedAudiences\>
3             \<add name="https-storefront.example.com" audience="
4                 https://storefront.example.com/" /\>
5                 **\<add name="https-accounts.example.com"
6                     audience="https://accounts.example.com/"
7                     /\>**
8             \</allowedAudiences\>
9         \</service\>
10        \</services\>
11    \</tokenManager\>
```

Alternatively, it is possible to export the native receiver .CR provisioning file for the store. This eliminates the need for First Time Use configuration of native Receivers. Distribute this file to all Windows and MAC Receiver clients.

If a Receiver is installed on the client, the .CR file type is recognized and double clicking on the provisioning file triggers it to be automatically imported.

## Configure Resource Filtering

January 4, 2019

This topic explains how to filter enumeration resources based on resource type and keywords. You can use this type of filtering with the more advanced customization offered by the Store Customization SDK. Using this SDK, you can control which apps and desktops are displayed to users, modify access conditions, and adjust launch parameters. For more information, see the Store Customization SDK.

Note: The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront admin console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of PowerShell before opening the StoreFront console.

### Configure filtering

Configure the filter using PowerShell cmdlets defined within the StoresModule. Use the following PowerShell snippet to load the required modules:

```
1 $dsInstallProp = Get-ItemProperty `
2 -Path HKLM:\SOFTWARE\Citrix\DeliveryServicesManagement -Name InstallDir
3 $dsInstallDir = $dsInstallProp.InstallDir
4 & $dsInstallDir\..\Scripts\ImportModules.ps1
```

## Filter by type

Use this to filter the resource enumeration by resource type. This is an inclusive filter, meaning it removes any resources that are not of the specified types from the resource enumeration result. Use the following cmdlets:

**Set-DSResourceFilterType:** Sets up enumeration filtering based on resource types.

**Get-DSResourceFilterType:** Gets the list of resource types that Storefront is allowed to return in enumeration.

Note: Resource types are applied before keywords.

## Filter by keywords

Use this to filter resources based on keywords, such as resources derived from XenDesktop or XenApp. Keywords are generated from mark-up in the description field of the corresponding resource.

The filter can operate either in inclusive or exclusive mode, but not both. The inclusive filter allows enumeration of resources matching the configured keywords and removes non matching resources from the enumeration. The exclusive filter removes resources matching the configured keywords from the enumeration. Use the following cmdlets:

**Set-DSResourceFilterKeyword:** Sets up enumeration filtering based on resource keywords.

**Get-DSResourceFilterKeyword:** Gets the list of filter keywords.

The following keywords are reserved and must not be used for filtering:

- Auto
- Mandatory

For more information on keywords, see [Optimize the user experience](#) and [Application delivery](#).

## Examples

This command will set filtering to exclude workflow resources from enumeration:

```
1 Set-DSResourceFilterKeyword -SiteId 1 -VirtualPath "/Citrix/Store" -
   ExcludeKeywords @("WFS")
```

This example will set allowed resource types to applications only:

```
1 Set-DSResourceFilterType -SiteId 1 -VirtualPath "/Citrix/Store" -  
   IncludeTypes @("Applications")
```

## Configure using configuration files

October 15, 2018

You can use configuration files to configure additional settings for Citrix StoreFront and Citrix Receiver for Web that cannot be set with the Citrix StoreFront management console.

The [Citrix StoreFront](#) settings you can configure include:

- Enable ICA file signing
- Disable file type association
- Customize the Citrix Receiver logon dialog box
- Prevent Receiver for Windows from caching passwords and usernames

The [Citrix Receiver for Web](#) settings you can configure include:

- How resources are displayed for users
- Disable the My Apps Folder View

## Configure StoreFront using the configuration files

February 22, 2019

This article describes additional configuration tasks that cannot be carried out using the Citrix StoreFront management console.

### Enable ICA file signing

StoreFront provides the option to digitally sign ICA files so that versions of Citrix Receiver that support this feature can verify that the file originates from a trusted source. When file signing is enabled in StoreFront, the ICA file generated when a user starts an application is signed using a certificate from the personal certificate store of the StoreFront server. ICA files can be signed using any hash algorithm supported by the operating system running on the StoreFront server. The digital signature is ignored by clients that do not support the feature or are not configured for ICA file signing. If the signing process fails, the ICA file is generated without a digital signature and sent to Citrix Receiver, the configuration of which determines whether the unsigned file is accepted.

To be used for ICA file signing with StoreFront, certificates must include the private key and be within the allowed validity period. If the certificate contains a key usage extension, this must allow the key to be used for digital signatures. Where an extended key usage extension is included, it must be set to code signing or server authentication.

For ICA file signing, Citrix recommends using a code signing or SSL signing certificate obtained from a public certification authority or from your organization's private certification authority. If you are unable to obtain a suitable certificate from a certification authority, you can either use an existing SSL certificate, such as a server certificate, or create a new root certification authority certificate and distribute it to users' devices.

ICA file signing is disabled by default in stores. To enable ICA file signing, you edit the store configuration file and execute Windows PowerShell commands. For more information about enabling ICA file signing in Citrix Receiver, see [ICA File Signing to protect against application or desktop launches from untrusted servers](#).

Note: The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront admin console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of PowerShell before opening the StoreFront console.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Ensure that the certificate you want to use to sign ICA files is available in the Citrix Delivery Services certificate store on the StoreFront server and not the current user's certificate store.
2. Use a text editor to open the web.config file for the store, which is typically located in the C:\inetpub\wwwroot\Citrix\storename\ directory, where storename is the name specified for the store when it was created.
3. Locate the following section in the file.

```
1 <certificateManager>
2   <certificates>
3     <clear />
4     <add ... />
5     ...
6   </certificates>
7 </certificateManager>
8 <!--NeedCopy-->
```

4. Include details of the certificate to be used for signing as shown below.

```
1 <certificateManager>
2   <certificates>
3     <clear />
4     <add id="certificateid" thumb="certificatethumbprint" />
5     <add ... />
6     ...
7   </certificates>
8 </certificateManager>
9 <!--NeedCopy-->
```

Where `certificateid` is a value that helps you to identify the certificate in the store configuration file and `certificatethumbprint` is the digest (or thumbprint) of the certificate data produced by the hash algorithm.

5. Locate the following element in the file.

```
1 <icaFileSigning enabled="False" certificateId="" hashAlgorithm="
   sha1" />
2 <!--NeedCopy-->
```

6. Change the value of the `enabled` attribute to `True` to enable ICA file signing for the store. Set the value of the `certificateId` attribute to the ID you used to identify the certificate, that is, `certificateid` in Step 4.
7. If you want to use a hash algorithm other than SHA-1, set the value of the `hashAlgorithm` attribute to `sha256`, `sha384`, or `sha512`, as required.
8. Using an account with local administrator permissions, start Windows PowerShell and, at a command prompt, type the following commands to enable the store to access the private key.

```
1 Add-PSSnapin Citrix.DeliveryServices.Framework.Commands
2 $certificate = Get-DSCertificate "certificatethumbprint"
3
4 Add-DSCertificateKeyReadAccess -certificate $certificates[0] -
   accountName "IIS APPPOOL\Citrix Delivery Services Resources"
5 <!--NeedCopy-->
```

Where `certificatethumbprint` is the digest of the certificate data produced by the hash algorithm.

## Disable file type association

By default, file type association is enabled in stores so that content is seamlessly redirected to users' subscribed applications when they open local files of the appropriate types. To disable file type association, you edit the store configuration file.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the web.config file for the store, which is typically located in the C:\inetpub\wwwroot\Citrix\storename\ directory, where storename is the name specified for the store when it was created.
2. Locate the following element in the file.

```
1 <farmset ... enableFileTypeAssociation="on" ... >  
2 <!--NeedCopy-->
```

3. Change the value of the enableFileTypeAssociation attribute to off to disable file type association for the store.

### Customize the Citrix Receiver logon dialog box

When Citrix Receiver users log on to a store, no title text is displayed on the logon dialog box, by default. You can display the default text “Please log on” or compose your own custom message. To display and customize the title text on the Citrix Receiver logon dialog box, you edit the files for the authentication service.

**Important:** In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the UsernamePassword.tfrm file for the authentication service, which is typically located in the C:\inetpub\wwwroot\Citrix\Authentication\App\_Data\Templates\ directory.
2. Locate the following lines in the file.

```
1 @* @Heading("ExplicitAuth:AuthenticateHeadingText") *@  
2 <!--NeedCopy-->
```

3. Uncomment the statement by removing the leading and trailing leading @\* and trailing \*@, as shown below.

```
1 @Heading("ExplicitAuth:AuthenticateHeadingText")  
2 <!--NeedCopy-->
```

Citrix Receiver users see the default title text “Please log on”, or the appropriate localized version of this text, when they log on to stores that use this authentication service.

4. To modify the title text, use a text editor to open the ExplicitAuth.resx file for the authentication service, which is typically located in the C:\inetpub\wwwroot\Citrix\Authentication\App\_Data\resources\ directory.
5. Locate the following elements in the file. Edit the text enclosed within the <value> element to modify the title text that users see on the Citrix Receiver logon dialog box when they access stores that use this authentication service.

```

1 <data name="AuthenticateHeadingText" xml:space="preserve">
2   <value>My Company Name</value>
3 </data>
4 <!--NeedCopy-->

```

To modify the Citrix Receiver logon dialog box title text for users in other locales, edit the localized files ExplicitAuth.languagecode.resx, where languagecode is the locale identifier.

### Prevent Citrix Receiver for Windows from caching passwords and usernames

By default, Citrix Receiver for Windows stores users’ passwords when they log on to StoreFront stores. To prevent Citrix Receiver for Windows, but not Citrix Receiver for Windows Enterprise, from caching users’ passwords, you edit the files for the authentication service.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the inetpub\wwwroot\Citrix\Authentication\App\_Data\Templates\UsernamePassw file.
2. Locate the following line in the file.

```

1 @SaveCredential(id: @GetTextValue("saveCredentialsId"), labelKey:
   "ExplicitFormsCommon:SaveCredentialsLabel", initiallyChecked:
   ControlValue("SaveCredentials"))
2 <!--NeedCopy-->

```

3. Comment the statement as shown below.

```

1 <!-- @SaveCredential(id: @GetTextValue("saveCredentialsId"),
   labelKey: "ExplicitFormsCommon:SaveCredentialsLabel",
   initiallyChecked: ControlValue("SaveCredentials")) -->

```

```
2 <!--NeedCopy-->
```

Citrix Receiver for Windows users must enter their passwords every time they log on to stores that use this authentication service. This setting does not apply to Citrix Receiver for Windows Enterprise.

### Warning

Using Registry Editor incorrectly can cause serious problems that can require you to reinstall the operating system. Citrix cannot guarantee that problems resulting from incorrect use of Registry Editor can be solved. Use Registry Editor at your own risk. Make sure you back up the registry before you edit it.

By default, Citrix Receiver for Windows automatically populated the last username entered. To suppress population of the username field, edit the registry on the user device:

1. Create a REG\_SZ value HKLM\SOFTWARE\Citrix\AuthManager\RememberUsername.
2. Set its value “false”.

## Configure Citrix Receiver for Web sites using the configuration files

February 25, 2021

This article describes additional configuration tasks for Citrix Receiver for Web sites that cannot be carried out using the Citrix StoreFront management console.

### Configure how resources are displayed for users

When both desktops and applications are available from a Citrix Receiver for Web site, separate desktop and application views are displayed by default. Users see the desktop view first when they log on to the site. If only a single desktop is available for a user, regardless of whether applications are also available from a site, that desktop starts automatically when the user logs on. To change these settings, you edit the site configuration file.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the web.config file for the Citrix Receiver for Web site, which is typically located in the C:\inetpub\wwwroot\Citrix\storenameWeb\ directory, where storename is the name specified for the store when it was created.

2. Locate the following element in the file.

```
1 <uiViews showDesktopsView="true" showAppsView="true" defaultView="
  desktops" />
2 <!--NeedCopy-->
```

3. Change the value of the showDesktopsView and showAppsView attributes to false to prevent desktops and applications, respectively, being displayed to users, even if they are available from the site. When both the desktop and application views are enabled, set the value of the defaultView attribute to apps to display the application view first when users log on to the site.
4. Locate the following element in the file.

```
1 <userInterface ... autoLaunchDesktop="true">
2 <!--NeedCopy-->
```

5. Change the value of the autoLaunchDesktop attribute to false to prevent Citrix Receiver for Web sites from automatically starting a desktop when a user logs on to the site and only a single desktop is available for that user.

When the autoLaunchDesktop attribute is set to true and a user for whom only one desktop is available logs on, that user's applications are not reconnected, regardless of the workspace control configuration.

Note: To enable Citrix Receiver for Web sites to start their desktops automatically, users accessing the site through Internet Explorer must add the site to the Local intranet or Trusted sites zones.

## Disable the My Apps Folder View

By default, Citrix Receiver for Web displays the My Apps Folder View for unauthenticated (access for unauthenticated users) and mandatory (all published applications are available in the Home screen without users subscribing to them) stores. This view displays applications in a folder hierarchy and includes a breadcrumb path.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

1. Use a text editor to open the web.config file for the Citrix Receiver for Web site, which is typically located in the C:\inetpub\wwwroot\Citrix\storenameWeb\ directory, where storename is the name specified for the store when it was created.
2. Locate the following element in the file.

```
1 <userInterface enableAppsFolderView="true">  
2 <!--NeedCopy-->
```

3. Change the value of the enableAppsFolderView attribute to false to disable Citrix Receiver for Web My Apps Folder View.

## Secure your StoreFront deployment

November 9, 2021

This article highlights areas that may have an impact on system security when deploying and configuring StoreFront.

### Configure Microsoft Internet Information Services (IIS)

You can configure StoreFront with a restricted IIS configuration. Note that this is not the default IIS configuration.

#### Filename extensions

You can disallow unlisted file name extensions.

#### StoreFront requires these file name extensions in Request Filtering:

- . (blank extension)
- .appcache
- .aspx
- .cr
- .css
- .dtd
- .png
- .htm
- .html
- .ica
- .ico
- .jpg
- .js
- .png
- .svg
- .txt
- .xml

**If download or upgrade of Citrix Receiver is enabled for Citrix Receiver for Web, StoreFront also requires these file name extensions:**

- .dmg
- .exe

**If Citrix Receiver for HTML5 is enabled, StoreFront also requires these file name extensions:**

- .eot
- .ttf
- .woff

### **MIME Types**

You can remove MIME Types corresponding to the following file types:

- .exe
- .dll
- .com
- .bat
- .csh

### **Request Filtering**

StoreFront requires the following HTTP verbs in Request Filtering. You can disallow unlisted verbs.

- GET
- POST
- HEAD

### **Other Microsoft IIS settings**

StoreFront does not require:

- CGI programs
- FastCGI programs

#### **Important**

- Do not configure IIS Authorization Rules. StoreFront supports authentication directly, and does not use or support IIS authentication.
- Do not select **Client certificates: Require**, in the SSL Settings for the StoreFront site. StoreFront installation configures the appropriate pages of the StoreFront site with this setting.
- StoreFront requires cookies. The Use Cookies setting must be selected. Do not select the cookieless/Use URI setting.
- StoreFront requires Full Trust. Do not set the global .NET trust level to High or lower.
- StoreFront does not support a separate application pool for each site. Do not modify these site settings.

## Configure user rights

When you install StoreFront, its application pools are granted the logon right **Log on as a service** and the privileges **Adjust memory quotas for a process**, **Generate security audits**, and **Replace a process level token**. This is normal installation behavior when application pools are created.

You do not need to change these user rights. These privileges are not used by StoreFront and are automatically disabled.

StoreFront installation creates the following Windows services:

- Citrix Configuration Replication (NT SERVICE\CitrixConfigurationReplication)
- Citrix Cluster Join (NT SERVICE\CitrixClusterService)
- Citrix Peer Resolution (NT SERVICE\Citrix Peer Resolution Service)
- Citrix Credential Wallet (NT SERVICE\CitrixCredentialWallet)
- Citrix Subscriptions Store (NT SERVICE\CitrixSubscriptionsStore)
- Citrix Default Domain Services (NT SERVICE\CitrixDefaultDomainService)

If you configure StoreFront Kerberos constrained delegation for XenApp 6.5, this creates the Citrix StoreFront Protocol Transition service (NT SERVICE\SYSTEM). This service requires a privilege not normally granted to Windows services.

## Configure service settings

The StoreFront Windows services listed above in the “Configure user rights” section are configured to log on as the NETWORK SERVICE identity. The Citrix StoreFront Protocol Transition service logs on as SYSTEM. Do not change this configuration.

## Configure group memberships

StoreFront installation adds the following services to the Administrators security group:

- Citrix Configuration Replication (NT SERVICE\CitrixConfigurationReplication)
- Citrix Cluster Join (NT SERVICE\CitrixClusterService)

These group memberships are required for StoreFront to operate correctly, to:

- Create, export, import and delete certificates, and set access permissions on them
- Read and write the Windows registry
- Add and remove Microsoft .NET Framework assemblies in the Global Assembly Cache (GAC)
- Access the folder **Program Files\Citrix**\<StoreFrontLocation>
- Add, modify, and remove IIS app pool identities and IIS web applications
- Add, modify, and remove local security groups and firewall rules
- Add and remove Windows services and PowerShell snap-ins
- Register Microsoft Windows Communication Framework (WCF) endpoints

In updates to StoreFront, this list of operations might change without notice.

StoreFront installation also creates the following local security groups:

- CitrixClusterMembers
- CitrixCWServiceReadUsers
- CitrixCWServiceWriteUsers
- CitrixDelegatedAuthenticatorUsers
- CitrixDelegatedDirectoryClaimFactoryUsers
- CitrixPNRSUsers
- CitrixStoreFrontPTServiceUsers
- CitrixSubscriptionServerUsers
- CitrixSubscriptionsStoreServiceUsers
- CitrixSubscriptionsSyncUsers
- CitrixStoreFrontAdministrators (from StoreFront 3.12.6000 onwards)

StoreFront maintains the membership of these security groups. They are used for access control within StoreFront, and are not applied to Windows resources such as files and folders. Do not modify these group memberships.

## Certificates in StoreFront

### Server certificates

Server certificates are used for machine identification and Transport Layer Security (TLS) transport security in StoreFront. If you decide to enable ICA file signing, StoreFront can also use certificates to digitally sign ICA files.

To enable email-based account discovery for users installing Citrix Receiver on a device for the first time, you must install a valid server certificate on the StoreFront server. The full chain to the root certificate must also be valid. For the best user experience, install a certificate with a Subject or Subject Alternative Name entry of **discoverReceiver.domain**, where domain is the Microsoft Active Directory domain containing your users' email accounts. Although you can use a wildcard certificate for the domain containing your users' email accounts, you must first ensure that the deployment of such certificates is permitted by your corporate security policy. Other certificates for the domain containing your users' email accounts can also be used, but users will see a certificate warning dialog box when Citrix Receiver first connects to the StoreFront server. Email-based account discovery cannot be used with any other certificate identities. For more information, see [Configure email-based account discovery](#).

If your users configure their accounts by entering store URLs directly into Citrix Receiver and do not use email-based account discovery, the certificate on the StoreFront server need only be valid for that server and have a valid chain to the root certificate.

### Token management certificates

Authentication services and stores each require certificates for token management. StoreFront generates a self-signed certificate when an authentication service or store is created. Self-signed certificates generated by StoreFront should not be used for any other purpose.

### Citrix Delivery Services certificates

StoreFront holds a number of certificates in a custom Windows certificate store (Citrix Delivery Services). The Citrix Configuration Replication service, Citrix Credential Wallet service, and Citrix Subscriptions Store service use these certificates. Each StoreFront server in a cluster has a copy of these certificates. These services do not rely on TLS for secure communications, and these certificates are not used as TLS server certificates. These certificates are created when a StoreFront store is created or StoreFront is installed. Do not modify the contents of this Windows certificate store.

### Code signing certificates

StoreFront installs various PowerShell scripts (.ps1) in the folder in `<InstallDirectory>\Scripts`. The default StoreFront installation does not use these scripts, but you can use them to simplify specific and infrequent configuration tasks. These scripts are signed, allowing StoreFront to support PowerShell execution policy. We recommend the **AllSigned** policy. (The **Restricted** policy is not supported, as it prevents PowerShell scripts from running.) StoreFront does not alter the PowerShell execution policy.

Add a code signing certificate to the Trusted Publishers store, because StoreFront does not add it automatically. Without a certificate added the StoreFront management console Snap-in does not load when you enable the **Turn on Script Execution** policy setting and set **Allow only signed script**.

If you run the scripts in a PowerShell session, Windows automatically adds the code signing certificate in the Trusted Publishers store when the PowerShell script is run with the **Always run** option in the **AllSigned** execution policy. (If you select the **Never run** option, the certificate is added to the Untrusted Certificates store, and StoreFront PowerShell scripts do not run.)

Once the code signing certificate is added to the Trusted Publishers store, its expiration is no longer checked by Windows. You can remove this certificate from the Trusted Publishers store after the StoreFront tasks have been completed.

### StoreFront communications

In a production environment, Citrix recommends using the Internet Protocol security (IPsec) or HTTPS protocols to secure data passing between StoreFront and your servers. IPsec is a set of standard extensions to the Internet Protocol that provides authenticated and encrypted communications with data integrity and replay protection. Because IPsec is a network-layer protocol set, higher level protocols can use it without modification. HTTPS uses the Secure Sockets Layer (SSL) and Transport Layer Security (TLS) protocols to provide strong data encryption.

The SSL Relay can be used to secure data traffic between StoreFront and XenApp servers. The SSL Relay is a default component of XenApp that performs host authentication and data encryption.

Citrix recommends securing communications between StoreFront and users' devices using NetScaler Gateway and HTTPS. To use HTTPS, StoreFront requires that the Microsoft Internet Information Services (IIS) instance hosting the authentication service and associated stores is configured for HTTPS. In the absence of the appropriate IIS configuration, StoreFront uses HTTP for communications. Citrix strongly recommends that you do not enable unsecured user connections to StoreFront in a production environment.

### **StoreFront security separation**

If you deploy any web applications in the same web domain (domain name and port) as StoreFront, then any security risks in those web applications could potentially reduce the security of your StoreFront deployment. Where a greater degree of security separation is required, Citrix recommends that you deploy StoreFront in a separate web domain.

### **ICA file signing**

StoreFront provides the option to digitally sign ICA files using a specified certificate on the server so that versions of Citrix Receiver that support this feature can verify that the file originates from a trusted source. ICA files can be signed using any hash algorithm supported by the operating system running on the StoreFront server, including SHA-1 and SHA-256. For more information, see [Enable ICA file signing](#).

### **User change password**

You can enable Receiver for Web site users logging on with Active Directory domain credentials to change their passwords, either at any time or only when they have expired. However, this exposes sensitive security functions to anyone who can access any of the stores that use the authentication service. If your organization has a security policy that reserves user password change functions for internal use only, ensure that none of the stores are accessible from outside your corporate network. When you create the authentication service, the default configuration prevents Receiver for Web site users from changing their passwords, even if they have expired. For more information, see [Optimize the user experience](#).

### **Customizations**

To strengthen security, do not write customizations that load content or scripts from servers not under your control. Copy the content or script into the Citrix Receiver for Web site custom folder where you

are making the customizations. If StoreFront is configured for HTTPS connections, ensure that any links to custom content or scripts also use HTTPS.

## Additional security information

### Note:

This information may change at any time, without notice.

Your organization may want to perform security scans of StoreFront for regulatory reasons. The preceding configuration options can help to eliminate some findings in security scan reports.

If there is a gateway between the security scanner and StoreFront, particular findings may relate to the gateway rather than to StoreFront itself. Security scan reports usually do not distinguish these findings (for example, TLS configuration). Because of this, technical descriptions in security scan reports can be misleading.

When interpreting security scan reports, note the following:

- HTML pages in StoreFront may not include clickjacking protection (by Content Security Policy or X-Frame-Options response headers). However, these HTML pages consist only of static content, and therefore clickjacking attacks are not relevant.
- The version of Microsoft IIS and the use of ASP.NET are visible in HTTP headers. However, this information is already apparent from the presence of StoreFront itself, because it relies on these technologies.
- When launching applications and desktops, StoreFront uses a token to protect against cross-site request forgery (CSRF). This token is sent as a cookie in a response without being marked as Secure or HttpOnly. When later sent in a request, the token is included in the query string of a URL. However, StoreFront does not rely on this mechanism to authenticate HTTP requests.
- StoreFront uses the open source component jQuery. According to the jQuery open source project, a change was made in jQuery 1.12.0 to mitigate potential vulnerabilities in a specific form of cross-domain request. This change was not a mitigation to a vulnerability in jQuery itself; it was a mitigation to potential misuse by application logic. The relevant Citrix application logic, in the Receiver for Web feature shared by NetScaler and StoreFront, does not use this specific form of cross-domain request, is not affected by this vulnerability, and did not benefit from this mitigation.

This mitigation was later removed in jQuery 1.12.3 for compatibility reasons. Since the Citrix application logic did not benefit from this mitigation, this removal has no material impact in the versions of NetScaler and StoreFront using jQuery 1.12.4.

## Export and import the StoreFront configuration

November 12, 2019

Note:

You can only import StoreFront configurations which are the same StoreFront version as the target StoreFront installation.

You can export the entire configuration of a StoreFront deployment. This includes both single server deployments and server group configurations. If an existing deployment is already present on the importing server, the current configuration is erased and then replaced by the configuration contained within the backup archive. If the target server is a clean factory default installation, a new deployment is created using the imported configuration stored within the backup. The exported configuration backup is in the form of a single .zip archive if unencrypted, or a .ctxzip if you choose to encrypt the backup file when it is created.

### Scenarios where configuration export and import can be used

- Only backup StoreFront deployments in a working and trusted state. Any changes to the configuration requires a new backup to be taken to replace the old one. You cannot modify existing backups as a file hash of the backup.zip file prevents modification.
- Backup BEFORE upgrading StoreFront for disaster recovery.
- Cloning existing testing StoreFront deployments to put into production
- Creating user acceptance environments by cloning production deployments into a test environment.
- Moving StoreFront during OS migrations such as upgrading the hosting OS from 2008R2 to 2019.
- Building extra server groups in multigeo deployments such as in large enterprises with multiple datacenters.

### Things to consider when exporting and importing a StoreFront configuration

- Do you currently use any Citrix published authentication SDK examples, such as Magic Word authentication or third party authentication customizations? If so, you must install these packages on ALL importing servers BEFORE importing a configuration containing extra authentication methods. The configuration import fails if required authentication SDK packages are not installed on any of the importing servers. If importing a configuration into a server group, install the authentication packages on all members of the group.
- You can encrypt or decrypt your configuration backups. The exporting and importing PowerShell cmdlets support both use cases.

- You can decrypt encrypted backups (.ctxzip) later, but StoreFront cannot re-encrypt unencrypted backup files (.zip). If an encrypted backup is required, perform the export again using a PowerShell credential object containing a password of your choice.
- The SiteID of the website in IIS where StoreFront is currently installed (exporting server) must match the SiteID of the target website in IIS (importing server) where you want to restore the backed up StoreFront configuration.

## PowerShell cmdlets

### Export-STFConfiguration

Parameter	Description
-TargetFolder (String)	The export path to the backup archive. Example: "\$env:userprofile\desktop\"
-Credential (PSCredential Object)	Specify a credential object to create an encrypted .ctxzip backup archive during export. The PowerShell credential object should contain the password to use for encryption and decryption. Do not use <b>-Credential</b> at the same time as the <b>-NoEncryption</b> parameter. Example: \$CredObject
-NoEncryption (Switch)	Specify that the backup archive should be an unencrypted .zip. Do not use <b>-NoEncryption</b> at the same time as the <b>-Credential</b> parameter.
-ZipFileName (String)	The name for the StoreFront configuration backup archive. Do not add a file extension, such as .zip or .ctxzip. The file extension is added automatically depending on whether the <b>-Credential</b> or <b>-NoEncryption</b> parameter is specified during export. Example: "backup"
-Force (Boolean)	This parameter automatically overwrites backup archives with the same file name as existing backup files already present in the specified export location.

**Important:**

The **SiteID** parameter found in StoreFront 3.5 was deprecated in version 3.6. It is no longer necessary to specify the **SiteID** when performing an import, as the SiteID contained within the backup archive is always be used. Ensure the SiteID matches the existing StoreFront website already configured within IIS on the importing server. **SiteID 1** to **SiteID 2** configuration imports are NOT supported.

**Import-STFConfiguration**

Parameter	Description
-ConfigurationZip (String)	The full path to the backup archive you want to import. This should also include the file extension. Use .zip for unencrypted and .ctxzip for encrypted backup archives. Example: <code>\$env:userprofile\desktop\backup.ctxzip</code>
-Credential (PSCredential Object)	Specify a credential object to decrypt an encrypted backup during import. Example: <code>\$CredObject</code>
-HostBaseURL (String)	If this parameter is included, the Host base URL you specify is used instead of the Host base URL from the exporting server. Example: <code>https://&lt;importingserver&gt;.example.com</code>

**Unprotect-STFConfigurationBackup**

Parameter	Description
-TargetFolder (String)	The export path to the backup archive. Example: <code>\$env:userprofile\desktop\</code>
-Credential (PSCredential Object)	Use this parameter to create an unencrypted copy of the encrypted backup archive. Specify the PowerShell credential object containing the password to use for decryption. Example: <code>\$CredObject</code>

Parameter	Description
-EncryptedConfigurationZip (String)	The full path of the encrypted backup archive you want to decrypt. You must specify the file extension .ctxzip. Example: <code>\$env:userprofile\desktop\backup.ctxzip</code>
-OutputFolder (String)	The path to create an unencrypted copy (.zip) of the encrypted (.ctxzip) backup archive. The original encrypted copy of the backup is retained so it can be reused. Do not specify a file name and file extension for the unencrypted copy. Example: <code>\$env:userprofile\desktop\</code>
-Force (Boolean)	This parameter automatically overwrites backup archives with the same file name as existing backup files already present in the specified export location.

## Configuration export and import examples

### Import the StoreFront cmdlets into the current PowerShell session

Open the PowerShell Integrated Scripting Environment (ISE) on the StoreFront server and run:

```

1 $env:PSModulePath = [Environment]::GetEnvironmentVariable('PSModulePath', 'Machine')
2 $SDKModules = 'C:\Program Files\Citrix\Receiver StoreFront\PowerShellSDK\Modules\Citrix.StoreFront'
3 Import-Module "$SDKModules\Citrix.StoreFront.psd1" -verbose
4 Import-Module "$SDKModules.Authentication\Citrix.StoreFront.Authentication.psd1" -verbose
5 Import-Module "$SDKModules.Roaming\Citrix.StoreFront.Roaming.psd1" -verbose
6 Import-Module "$SDKModules.Stores\Citrix.StoreFront.Stores.psd1" -verbose
7 Import-Module "$SDKModules.WebReceiver\Citrix.StoreFront.WebReceiver.psd1" -verbose

```

## Single server scenarios

### Create an unencrypted backup of an existing configuration on Server A and restore it onto the same deployment

Export the configuration of the server you wish to back up.

```
1 Export-STFConfiguration -targetFolder "$env:userprofile\desktop\" -  
  zipFileName "backup" -NoEncryption
```

Copy the backup.zip file to a safe location. You can use this backup for disaster recovery to restore the server to its previous state.

```
1 Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
  backup.zip" -HostBaseURL "https://storefront.example.com"
```

### Back up an existing configuration on Server A and restore it onto Server B to create a clone of an existing server

Export the configuration of the server you wish to back up.

```
1 Export-STFConfiguration -targetFolder "$env:userprofile\desktop\" -  
  zipFileName "backup" -NoEncryption
```

Copy the backup.zip file to the desktop of server B.

```
1 Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
  backup.zip" -HostBaseURL "https://serverB.example.com"
```

### StoreFront is already deployed onto a custom website in IIS. Restore the configuration onto another custom website deployment

Server A has StoreFront deployed on a custom website location rather than the usual default website within IIS. The IIS SiteID for the second website created in IIS is 2. The StoreFront website's physical path can be on another nonsystem drive such as d:\ or on the default c:\ system drive but should use an IIS SiteID greater than 1.

A new website called StoreFront has been configured within IIS, which uses **SiteID = 2**. StoreFront is already deployed on the custom website in IIS with its physical path on drive d:\inetpub\wwwroot

1. Export a copy of the Server A configuration.
2. On Server B, configure IIS with a new website called **StoreFront**, which also uses **SiteID 2**.

3. Import the Server A configuration onto Server B. The site ID contained in the backup is used and must match the target website where you want to import the StoreFront configuration.

```
Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
backup.ctxzip"-HostBaseURL "https://serverB.example.com"
```

### Server group scenarios

#### **Scenario 1: Backup an existing server group configuration and restore it later onto the same server group deployment**

A previous configuration backup was taken while only two StoreFront servers, 2012R2-A and 2012R2-B, were members of the server group. Within the backup archive is a record of the **CitrixClusterMembership** at the time the backup was taken containing only the two original servers 2012R2-A and 2012R2-B. The StoreFront server group deployment has subsequently increased in size since the original backup was taken due to business demand, so an additional node 2012R2-C has been added to the server group. The underlying StoreFront configuration of the server group held in the backup has not changed. The current CitrixClusterMembership of three servers must be maintained even if an old backup containing only the two original server group nodes is imported. During import the current cluster membership is preserved and then written back once the configuration has been successfully imported onto the primary server. The import also preserves the current CitrixClusterMembership if server group nodes were removed from the server group since the original backup was taken.

1. Export the Server Group 1 configuration from 2012R2-A, which is the primary server used to manage the entire server group.
1. Later you add an additional server, 2012R2-C to the existing server group.
1. The configuration of the server group must be restored to a known previously working state. StoreFront backs up the current CitrixClusterMembership of three servers during the import process, and then restores it after the import has succeeded.
2. Import the Server Group 1 configuration back onto node 2012R2-A.

```
Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
backup.ctxzip"-HostBaseURL "https://servergroup1.example.com"
```

3. Propagate the newly imported configuration to the entire server group, so all servers have a consistent configuration after import.

#### **Scenario 2: Backup an existing configuration from Server Group 1 and use it to create a new Server Group on a different factory default installation. You can then add other new server group members to the new primary server**

Server Group 2 is created containing two new servers, 2012R2-C and 2012R2-D. The Server Group 2 configuration will be based on the configuration of an existing deployment, Server Group 1, which also contains two servers 2012R2-A and 2012R2-B. The CitrixClusterMembership contained within the backup archive is not used when creating a new server group. The current CitrixClusterMembership is always backed up and then restored after the import is successful. When creating a new deployment using an imported configuration, the CitrixClusterMembership security group contains only the importing server until additional servers are joined to the new group. Server Group 2 is a new deployment and intended to coexist alongside Server Group 1. Specify the `-HostBaseURL` parameter. Server Group 2 will be created using a new factory default StoreFront installation.

1. Export the Server Group 1 configuration from 2012R2-A, which is the primary server used to manage the entire server group.
2. Import the Server Group 1 configuration onto node 2012R2-C, which will be the primary server used to manage the newly created Server Group 2.

```
Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
backup.ctxzip"-HostBaseURL "https://servergroup2.example.com"
```

3. Join any additional servers that will be part of the new Server Group 2 deployment. Propagation of the newly imported configuration from Server Group 1 to all new members of Server Group 2 is automatic, as this forms part of the normal join process when a new server is added.

### **Scenario 3: Backup an existing configuration from Server Group A and use it to overwrite the existing Server Group B configuration**

Server Group 1 and Server Group 2 already exist in two separate data centers. Many StoreFront configuration changes are made on Server Group 1, which you should apply to Server Group 2 in the other data center. You can port the changes from Server Group 1 to Server Group 2. Do not use the **CitrixClusterMembership** within the backup archive on Server Group 2. Specify the **-HostBaseURL** parameter during import, as the Server Group 2 host base URL should not be changed to the same FQDN that is currently in use by Server Group 1. Server Group 2 is an existing deployment.

1. Export the Server Group 1 configuration from 2012R2-A, which is the primary server used to manage the entire server group.
2. Import the Server Group 1 configuration onto the factory default installation on node 2012R2-C, which will be the primary server of the new Server Group 2.

```
Import-STFConfiguration -configurationZip "$env:userprofile\desktop\  
backup.ctxzip"-NoEncryption -HostBaseURL "https://servergroup2.example.  
com"
```

## Create an encrypted backup of your server configuration

A PowerShell credential object comprises both a Windows account username and a password. PowerShell credential objects ensure that your password stays protected in memory.

### Note:

To encrypt a configuration backup archive, you need only the password to perform encryption and decryption. The username stored within the credential object is not used. You must create a credential object containing the same password within the PowerShell session that is used on both the exporting and importing servers. Within the credential object you can specify any user.

PowerShell requires that you specify a user when creating a new credential object. This example code obtains the currently logged on Windows user for convenience.

Create a PowerShell Credential Object within your Powershell session on the exporting server.

```
1 $User = [System.Security.Principal.WindowsIdentity]::GetCurrent().Name
2 $Password = "Pa55w0rd"
3 $Password = $Password | ConvertTo-SecureString -asPlainText -Force
4 $CredObject = New-Object System.Management.Automation.PSCredential(
    $User,$Password)
```

Export the configuration to backup.ctxzip which is an encrypted zip file.

```
1 Export-STFConfiguration -targetFolder "$env:userprofile\desktop\" -
    zipFileName "backup" -Credential $CredObject
```

Create an identical PowerShell Credential Object within your Powershell session on the importing server.

```
1 Import-STFConfiguration -configurationZip "$env:userprofile\desktop\
    backup.ctxzip" -Credential $CredObject -HostBaseURL "https://
    storefront.example.com"
```

## Unprotect an existing encrypted backup archive

```
1 $User = [System.Security.Principal.WindowsIdentity]::GetCurrent().Name
2 $Password = "Pa55w0rd"
3 $Password = $Password | ConvertTo-SecureString -asPlainText -Force
4 $CredObject = New-Object System.Management.Automation.PSCredential(
    $User,$Password)
5
6 Unprotect-STFConfigurationExport -encryptedConfigurationZip "$env:
    userprofile\desktop\backup.ctxzip" -credential $CredObject -
    outputFolder "c:\StoreFrontBackups" -Force
```

## StoreFront SDK

February 25, 2021

Citrix StoreFront provides an SDK based on a number of Microsoft Windows PowerShell version 3.0 modules. With the SDK, you can perform the same tasks as you would with the StoreFront MMC console, together with tasks you cannot do with the console alone.

For the SDK Reference, see [StoreFront SDK](#).

### Key differences between the StoreFront 3.0 and current StoreFront SDK

- **High-level SDK Examples** - This version provides high-level SDK scripts that enable you to script and automate StoreFront deployments quickly and easily. You can tailor the high-level examples to your particular requirements enabling you to create a new deployment simply by running one script.
- **\*\*New low-level SDK\*\*** - Citrix provides a documented low-level StoreFront SDK enabling the configuration of deployments including stores, authentication methods, Citrix Receiver for Web and Unified Citrix Receiver sites, as well as remote access with NetScaler Gateway.
- **Backwards Compatibility** - StoreFront 3.6 still contains the StoreFront 3.0 and earlier APIs so existing scripts can be gradually transitioned to the new SDK.

#### Important

Backwards compatibility with StoreFront 3.0 has been maintained where possible and practicable. However, Citrix recommends when writing new scripts, use the new **Citrix.StoreFront.\*** modules, as the StoreFront 3.0 SDK is deprecated and will eventually be removed.

### Use the SDK

The SDK comprises of a number of PowerShell snap-ins installed automatically by the installation wizard when you install and configure various StoreFront components.

To access and run the cmdlets:

1. Start a shell in PowerShell 3.0.  
You must run the shell or script using a member of the local administrators group on the StoreFront server.
2. To use SDK cmdlets within scripts, set the execution policy in PowerShell.  
For more information about PowerShell execution policy, see your Microsoft documentation.
3. Add the modules you require into the PowerShell environment using the **Add -Module** command in the Windows PowerShell console. For example, type:

```
1 Import-Module Citrix.StoreFront
2 <!--NeedCopy-->
```

To import all the cmdlets, type:

```
1 Get-Module -ListAvailable | Where-Object {
2     $_.Name.StartsWith("Citrix.StoreFront") }
3     | Import-Module
4
5 <!--NeedCopy-->
```

After importing, you have access to the cmdlets and their associated help.

## Get started with the SDK

To create a script, perform the following steps:

1. Take one of the provided SDK examples installed by StoreFront into the **%Program-Files%\Citrix\Receiver StoreFront\PowerShellSDK\Examples** folder.
2. To help you customize your own script, review the example script to understand what each part is doing. For more information, see the example use case, which explains in detail the script's actions.
3. Convert and adapt the example scripts to turn them into a script that is more consumable. To do this:
  - Use the PowerShell ISE or a similar tool to edit the script.
  - Use variables to assign values that are to be reused or modified.
  - Remove any commands that are not required.
  - Note that StoreFront cmdlets can be identified by the prefix STF.
  - Use the Get-Help cmdlet supplying the cmdlet name and -Full parameter for more information on a specific command.

### Examples

**Note:** When creating a script, to ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described above rather than copying and pasting the example scripts.

---

Examples	Description
<Example: Create a Simple Deployment>	Script: creates a simple deployment with a StoreFront controller configured with a single XenDesktop server.

<Example: Create a Remote Access Deployment>	Script: builds on the previous script to add remote access to the deployment.
<Example: Create a Remote Access Deployment with Optimal Launch Gateway>	Script: builds on the previous script to add preferred optimal launch gateways for a better user experience.
<Example: Create a Deployment with a Desktop Appliance Site>	Script: creates a simple deployment configured with a Desktop Appliance site.

### Example: Create a simple deployment

The following example shows how to create a simple deployment configured with one XenDesktop controller.

Before you begin, make sure you follow the steps detailed in [Get Started with the SDK](#). This example can be customized using the methods described to produce a script for automating StoreFront deployment.

Note: To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script.

#### Understand the script

This section explains what each part of the script produced by StoreFront is doing. This will help you with the customization of your own script.

- Sets the error handling requirements and imports the required StoreFront modules. Imports are not required in newer versions of PowerShell.

Param(

```

1  \[Parameter(Mandatory=$true)\]
2
3  \[Uri\]$HostbaseUrl,
4
5  \[long\]$SiteId = 1,
6
7  \[ValidateSet("XenDesktop","XenApp","AppController","VDIinaBox")\]
8
9  \[string\]$Farmtype = "XenDesktop",
10
11 \[Parameter(Mandatory=$true)\]
12

```

```

13 \[string\[\\]\]$FarmServers,
14
15 \[string\]$StoreVirtualPath = "/Citrix/Store",
16
17 \[bool\]$LoadbalanceServers = $false,
18
19 \[int\]$Port = 80,
20
21 \[int\]$SSLRelayPort = 443,
22
23 \[ValidateSet("HTTP","HTTPS","SSL")\]
24
25 \[string\]$TransportType = "HTTP"

```

)

# Import StoreFront modules. Required for versions of PowerShell earlier than 3.0 that do not support autoloading

Import-Module Citrix.StoreFront

Import-Module Citrix.StoreFront.Stores

Import-Module Citrix.StoreFront.Authentication

Import-Module Citrix.StoreFront.WebReceiver

- Automates the virtual path of the authentication and Citrix Receiver for Web services based on the **\$StoreVirtualPath** supplied.

# Determine the Authentication and Receiver virtual path to use based of the Store

\$authenticationVirtualPath = "\$(\$StoreIISPath.TrimEnd('/'))Auth"

\$receiverVirtualPath = "\$(\$StoreVirtualPath.TrimEnd('/'))Web"

- Creates a new deployment if one is not already present in preparation for adding the required StoreFront services. **-Confirm:\$false** suppresses the requirement to confirm the deployment can proceed.

# Determine if the deployment already exists

\$existingDeployment = Get-STFDeployment

if(-not \$existingDeployment)

{

```

1 \# Install the required StoreFront components
2

```

```
3 Add-STFDeployment -HostBaseUrl $HostbaseUrl -SiteId $SiteId -Confirm:
  $false
```

```
}
```

```
elseif($existingDeployment.HostbaseUrl -eq $HostbaseUrl)
```

```
{
```

```
1 \# The deployment exists but it is configured to the desired hostbase
  url
2
3 Write-Output "A deployment has already been created with the specified
  hostbase url on this server and will be used."
```

```
}
```

```
else
```

```
{
```

```
1 Write-Error "A deployment has already been created on this server with
  a different host base url."
```

```
}
```

- Creates a new authentication service if one does not exist at the specified virtual path. The default authentication method of username and password is enabled.

```
# Determine if the authentication service at the specified virtual path exists
```

```
$authentication = Get-STFAuthenticationService -VirtualPath $authenticationVirtualPath
```

```
if(-not $authentication)
```

```
{
```

```
1 \# Add an Authentication service using the IIS path of the Store
  appended with Auth
2
3 $authentication = Add-STFAuthenticationService
  $authenticationVirtualPath
```

```
}
```

```
else
```

```
{
```

```
1 Write-Output "An Authentication service already exists at the specified
   virtual path and will be used."
```

```
}
```

- Creates a new authentication service if one does not exist at the specified virtual path. The default authentication method of username and password is enabled.

```
# Determine if the authentication service at the specified virtual path exists
```

```
$authentication = Get-STFAuthenticationService -VirtualPath $authenticationVirtualPath
```

```
if(-not $authentication)
```

```
{
```

```
1 \# Add an Authentication service using the IIS path of the Store
   appended with Auth
2
3 $authentication = Add-STFAuthenticationService
   $authenticationVirtualPath
```

```
}
```

```
else
```

```
{
```

```
1 Write-Output "An Authentication service already exists at the specified
   virtual path and will be used."
```

```
}
```

- Creates the new store service configured with one XenDesktop controller with the servers defined in the array **\$XenDesktopServers** at the specified virtual path if one does not already exist.

```
# Determine if the store service at the specified virtual path exists
```

```
$store = Get-STFStoreService -VirtualPath $StoreVirtualPath
```

```
if(-not $store)
```

```
{
```

```
# Add a Store that uses the new Authentication service configured to publish resources from the supplied servers
```

```
$store = Add-STFStoreService -VirtualPath $StoreVirtualPath -AuthenticationService $authentication
-FarmName $Farmtype -FarmType $Farmtype -Servers $FarmServers -LoadBalance $Loadbalance-
Servers '
```

```

1      -Port $Port -SSLRelayPort $SSLRelayPort -TransportType
      $TransportType
}
else
{
1  Write-Output "A Store service already exists at the specified virtual
2      path and will be used. Farm and servers will be appended to this
3      store."
4
5  \# Get the number of farms configured in the store
6
7  $farmCount = (Get-STFStoreFarmConfiguration $store).Farms.Count
8
9  \# Append the farm to the store with a unique name
10
11 Add-STFStoreFarm -StoreService $store -FarmName "Controller$(($farmCount
      + 1)" -FarmType $FarmType -Servers $FarmServers -LoadBalance
      $LoadbalanceServers -Port $Port `
12     -SSLRelayPort $SSLRelayPort -TransportType $TransportType
}

• Adds a Citrix Receiver for Web service at the specified IIS virtual path to access applications
  published in the store created above.

# Determine if the receiver service at the specified virtual path exists
$receiver = Get-STFWebReceiverService -VirtualPath $receiverVirtualPath
if(-not $receiver)
{
1  \# Add a Receiver for Web site so users can access the applications and
2      desktops in the published in the Store
3
4  $receiver = Add-STFWebReceiverService -VirtualPath $receiverVirtualPath
5      -StoreService $store
}
else
{

```

```
1 Write-Output "A Web Receiver service already exists at the specified
   virtual path and will be used."
```

```
}
```

- Enables XenApp services for the store so older Citrix Receiver clients can connect to published applications.

```
# Determine if PNA is configured for the Store service
```

```
$storePnaSettings = Get-STFStorePna -StoreService $store
```

```
if(-not $storePnaSettings.PnaEnabled)
```

```
{
```

```
# Enable XenApp services on the store and make it the default for this server
```

```
Enable-STFStorePna -StoreService $store -AllowUserPasswordChange -DefaultPnaService
```

```
}
```

### **Example: Create a remote access deployment**

The following example builds on the previous script to add a deployment with remote access.

Before you begin, make sure you follow the steps detailed in *Get Started with the SDK*. This example can be customized using the methods described to produce a script for automating StoreFront deployment.

Note: To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script.

### **Understand the script**

This section explains what each part of the script produced by StoreFront is doing. This will help you with the customization of your own script.

- Sets the error handling requirements and import the required StoreFront modules. Imports are not required in newer versions of PowerShell.

```
Param(
```

```
1 \[Parameter(Mandatory=$true)\]
2
3 \[Uri\]$HostbaseUrl,
4
5 \[Parameter(Mandatory=$true)\]
6
```

```
7  \[long\]$SiteId = 1,  
8  
9  \[string\]$Farmtype = "XenDesktop",  
10  
11 \[Parameter(Mandatory=$true)\]  
12  
13 \[string\[\]\]$FarmServers,  
14  
15 \[string\]$StoreVirtualPath = "/Citrix/Store",  
16  
17 \[bool\]$LoadbalanceServers = $false,  
18  
19 \[int\]$Port = 80,  
20  
21 \[int\]$SSLRelayPort = 443,  
22  
23 \[ValidateSet("HTTP","HTTPS","SSL")\]  
24  
25 \[string\]$TransportType = "HTTP",  
26  
27 \[Parameter(Mandatory=$true)\]  
28  
29 \[Uri\]$GatewayUrl,  
30  
31 \[Parameter(Mandatory=$true)\]  
32  
33 \[Uri\]$GatewayCallbackUrl,  
34  
35 \[Parameter(Mandatory=$true)\]  
36  
37 \[string\[\]\]$GatewaySTAUrls,  
38  
39 \[string\]$GatewaySubnetIP,  
40  
41 \[Parameter(Mandatory=$true)\]  
42  
43 \[string\]$GatewayName
```

)

Set-StrictMode -Version 2.0

# Any failure is a terminating failure.

\$ErrorActionPreference = 'Stop'

\$ReportErrorShowStackTrace = \$true

```
$ReportErrorShowInnerException = $true
```

```
# Import StoreFront modules. Required for versions of PowerShell earlier than 3.0 that do not support autoloading
```

```
Import-Module Citrix.StoreFront
```

```
Import-Module Citrix.StoreFront.Stores
```

```
Import-Module Citrix.StoreFront.Roaming
```

- Create an internal access StoreFront deployment by calling the previous examples script. The base deployment will be extended to support remote access.

```
# Create a simple deployment by invoking the SimpleDeployment example
```

```
$scriptDirectory = Split-Path -Path $MyInvocation.MyCommand.Definition -Parent
```

```
$scriptPath = Join-Path $scriptDirectory "SimpleDeployment.ps1"
```

```
& $scriptPath -HostbaseUrl $HostbaseUrl -SiteId $SiteId -FarmServers $FarmServers -StoreVirtualPath $StoreVirtualPath -Farmtype $Farmtype '
```

```
1 -LoadbalanceServers $LoadbalanceServers -Port $Port -SSLRelayPort $SSLRelayPort -TransportType $TransportType
```

- Gets services created in the simple deployment as they need to be updated to support the remote access scenario.

```
# Determine the Authentication and Receiver sites based on the Store
```

```
$store = Get-STFStoreService -VirtualPath $StoreVirtualPath
```

```
$authentication = Get-STFAuthenticationService -StoreService $store
```

```
$receiverForWeb = Get-STFWebReceiverService -StoreService $store
```

- Enables CitrixAGBasic on the Citrix Receiver for Web service required for remote access using NetScaler Gateway. Get the Citrix Receiver for Web CitrixAGBasic and ExplicitForms authentication method from the supported protocols.

```
# Get the Citrix Receiver for Web CitrixAGBasic and ExplicitForms authentication method from the supported protocols
```

```
# Included for demonstration purposes as the protocol name can be used directly if known
```

```
$receiverMethods = Get-Where-Object { $_ -match "Explicit" -or $_ -match "CitrixAG" }  
STFWebReceiverAuthenticationMethodsAvailable
```

```
# Enable CitrixAGBasic in Receiver for Web (required for remote access)
```

```
Set-STFWebReceiverService $receiverForWeb -AuthenticationMethods $receiverMethods
```

- Enables CitrixAGBasic on the authentication service. This is required for remote access.

```
# Get the CitrixAGBasic authentication method from the protocols installed.
```

```
# Included for demonstration purposes as the protocol name can be used directly if known
```

```
$citrixAGBasic = Where-Object { $_ -match "CitrixAGBasic" }
Get-STFAuthenticationProtocolsAvailable
```

```
# Enable CitrixAGBasic in the Authentication service (required for remote access)
```

```
Enable-STFAuthenticationServiceProtocol -AuthenticationService $authentication -Name $citrixAG-
Basic
```

- Adds a new remote access Gateway, adding the optional subnet ipaddress is supplied and registers it with the store to be accessed remotely.

```
# Add a new Gateway used to access the new store remotely
```

```
Add-STFRoamingGateway -Name "NetScaler10x" -LogonType Domain -Version Version10_0_69_4
-GatewayUrl $GatewayUrl '
```

```
-CallbackUrl $GatewayCallbackUrl -SecureTicketAuthorityUrls $GatewaySTAUrls
```

```
# Get the new Gateway from the configuration (Add-STFRoamingGateway will return the new Gateway
if -PassThru is supplied as a parameter)
```

```
$gateway = Get-STFRoamingGateway -Name $GatewayName
```

```
# If the gateway subnet was provided then set it on the gateway object
```

```
if($GatewaySubnetIP)
```

```
{
```

```
1 Set-STFRoamingGateway -Gateway $gateway -SubnetIPAddress
   $GatewaySubnetIP
```

```
}
```

```
# Register the Gateway with the new Store
```

```
Register-STFStoreGateway -Gateway $gateway -StoreService $store -DefaultGateway
```

### Example: Create a remote access deployment with optimal launch Gateway

The following example builds on the previous script to add a deployment with optimal launch Gateway remote access.

Before you begin, make sure you follow the steps detailed in *Get Started with the SDK*. This example can be customized using the methods described to produce a script for automating StoreFront deployment.

Note: To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script.

### Understand the script

This section explains what each part of the script produced by StoreFront is doing. This will help you with the customization of your own script.

- Sets the error handling requirements and imports the required StoreFront modules. Imports are not required in newer versions of PowerShell.

```

```
Import-Module Citrix.StoreFront.Stores
```

```
Import-Module Citrix.StoreFront.Roaming
```

- Calls into the remote access deployment script to configure the basic deployment and add remote access.

```
# Create a remote access deployment
```

```
$scriptDirectory = Split-Path -Path $MyInvocation.MyCommand.Definition -Parent
$scriptPath = Join-Path $scriptDirectory "RemoteAccessDeployment.ps1"
&$scriptPath -HostbaseUrl $HostbaseUrl -SiteId $SiteId -FarmServers $FarmServers -StoreVirtualPath
$StoreVirtualPath -Farmtype $Farmtype '
```

```
1 -LoadbalanceServers $LoadbalanceServers -Port $Port -SSLRelayPort
   $SSLRelayPort -TransportType $TransportType `
2
3 -GatewayUrl $GatewayUrl -GatewayCallbackUrl $GatewayCallbackUrl -
   GatewaySTAUrIs $GatewaySTAUrIs -GatewayName $GatewayName
```

- Adds the preferred optimal launch gateway and get it from the list of configured gateways.

```
# Add a new Gateway used for remote HDX access to desktops and apps
```

```
$gateway = Add-STFRoamingGateway -Name $OptimalGatewayName -LogonType UsedForHDXOnly
-GatewayUrl $OptimalGatewayUrl -SecureTicketAuthorityUrls $OptimalGatewaySTAUrIs -PasThru
```

- Gets the store service to use the optimal gateway, register it assigning it to launches from the farm named.

```
# Get the Store configured by SimpleDeployment.ps1
```

```
$store = Get-STFStoreService -VirtualPath $StoreVirtualPath
```

```
# Register the Gateway with the new Store for launch against all of the farms (currently just one)
```

```
$farmNames =
@($store.FarmsConfiguration.Farms
```

```
                    foreach { $_.FarmName })
```

```
Register-STFStoreOptimalLaunchGateway -Gateway $gateway -StoreService $store -FarmName
$farmNames
```

### Example: Create a deployment with a Desktop Appliance site

The following example builds on the simple deployment example to add a deployment with Desktop Appliance site.

Before you begin, make sure you follow the steps detailed in Get Started with the SDK. This example can be customized using the methods described to produce a script for automating StoreFront deployment.

Note: To ensure you always get the latest enhancements and fixes, Citrix recommends you follow the procedure described in this document, rather than copying and pasting the example script.

## Understand the script

# Import StoreFront modules. Required for versions of PowerShell earlier than 3.0 that do not support autoloading

Import-Module Citrix.StoreFront

Import-Module Citrix.StoreFront.Stores

Import-Module Citrix.StoreFront.Roaming

- Automate a desktop appliance path based on that of the \$StoreVirtualPath.

\$desktopApplianceVirtualPath = "\$(\$StorePath.TrimEnd('/'))Appliance"

- Calls into the simple deployment script to configure a default deployment with the required services.

# Create a remote access deployment

\$scriptDirectory = Split-Path -Path \$MyInvocation.MyCommand.Definition -Parent

\$scriptPath = Join-Path \$scriptDirectory "RemoteAccessDeployment.ps1"

```
& $scriptPath -HostbaseUrl $HostbaseUrl -SiteId $SiteId -FarmServers $FarmServers -StoreVirtualPath $StoreVirtualPath -Farmtype $Farmtype '
```

```
1 -LoadbalanceServers $LoadbalanceServers -Port $Port -SSLRelayPort
   $SSLRelayPort -TransportType $TransportType `
2
3 -GatewayUrl $GatewayUrl -GatewayCallbackUrl $GatewayCallbackUrl -
   GatewaySTAUrIs $GatewaySTAUrIs -GatewayName $GatewayName
```

- Gets the store service to use for the Desktop Appliance site. Use the **Add-STFDesktopApplianceService** cmdlet to add the new site with MultiDesktop and Explicit username and password authentication.

```
$store = Get-STFStoreService -VirtualPath $StoreVirtualPath
```

```
# Create a new Desktop Appliance site using the desktops published by the Store Service
```

```
Add-STFDesktopApplianceService -VirtualPath $desktopApplianceVirtualPath -StoreService $store -
EnableExplicit
```

### Example: Exchange metadata between the Identity Provider and the Service Provider (StoreFront) for SAML authentication

SAML authentication can be configured in the StoreFront management console (see [Configure the authentication service](#)) or using the following PowerShell cmdlets: Export-STFSamlEncryptionCertificate, Export-STFSamlSigningCertificate, Import-STFSamlEncryptionCertificate, Import-STFSamlSigningCertificate, New-STFSamlEncryptionCertificate, New-STFSamlIdPCertificate, New-STFSamlSigningCertificate.

You can use the cmdlet, **Update-STFSamlIdPFromMetadata**, to exchange metadata (identifiers, certificates, endpoints and other configuration) between the Identity Provider and the Service Provider, which is StoreFront in this case.

For a StoreFront Store, named “Store”, with its dedicated authentication service, the metadata endpoint will be:

```
https://<storefront host>/Citrix/StoreAuth/SamlForms/ServiceProvider/Metadata
```

If your Identity Provider supports metadata import, then you can point it at the above URL. **Note:** This must be done over HTTPS.

For StoreFront to consume the metadata from an Identity Provider, the following PowerShell can be used:

```
1 Get-Module "Citrix.StoreFront*" -ListAvailable | Import-Module
2
3 # Remember to change this with the virtual path of your Store.
4 $StoreVirtualPath = "/Citrix/Store"
```

```
5
6 $store = Get-STFStoreService -VirtualPath $StoreVirtualPath
7 $auth = Get-STFAuthenticationService -StoreService $store
8
9 # To read the metadata directly from the Identity Provider, use the
  following:
10 # Note again this is only allowed for https endpoints
11 Update-STFSamlIdPFromMetadata -AuthenticationService $auth -Url https:
  //example.com/FederationMetadata/2007-06/FederationMetadata.xml
12
13 # If the metadata has already been download, use the following:
14 # Note: Ensure that the file is encoded as UTF-8
15 Update-STFSamlIdPFromMetadata -AuthenticationService $auth -FilePath "C
  :\Users\exampleusername\Downloads\FederationMetadata.xml"
```

### Example: List the metadata and ACS endpoints for a specified store for SAML authentication

You can use the following script to list out the metadata and ACS (Assertion Consumer Service) endpoints for a specified store.

```
1 # Change this value for your Store
2 $storeVirtualPath = "/Citrix/Store"
3
4 $auth = Get-STFAuthenticationService -Store (Get-STFStoreService -
  VirtualPath $storeVirtualPath)
5 $spId = $auth.AuthenticationSettings["samlForms"].SamlSettings.
  ServiceProvider.Uri.AbsoluteUri
6 $acs = New-Object System.Uri $auth.Routing.HostbaseUrl, ($auth.
  VirtualPath + "/SamlForms/AssertionConsumerService")
7 $md = New-Object System.Uri $auth.Routing.HostbaseUrl, ($auth.
  VirtualPath + "/SamlForms/ServiceProvider/Metadata")
8 $samlTest = New-Object System.Uri $auth.Routing.HostbaseUrl, ($auth.
  VirtualPath + "/SamlTest")
9 Write-Host "SAML Service Provider information:
10 Service Provider ID: $spId
11 Assertion Consumer Service: $acs
12 Metadata: $md
13 Test Page: $samlTest"
```

### Example of the output

```
1 SAML Service Provider information:
2 Service Provider ID: https://storefront.example.com/Citrix/StoreAuth
```

```
3 Assertion Consumer Service: https://storefront.example.com/Citrix/
  StoreAuth/SamlForms/AssertionConsumerService
4 Metadata: https://storefront.example.com/Citrix/StoreAuth/SamlForms/
  ServiceProvider/Metadata
5 Test Page: https://storefront.example.com/Citrix/StoreAuth/SamlTest
```

## Troubleshoot StoreFront

January 7, 2020

When StoreFront is installed or uninstalled, the following log files are created by the StoreFront installer in the `C:\Windows\Temp\StoreFront` directory. The file names reflect the components that created them and include time stamps.

- `Citrix-DeliveryServicesRoleManager-*.log`—Created when StoreFront is installed interactively.
- `Citrix-DeliveryServicesSetupConsole-*.log`—Created when StoreFront is installed silently and when StoreFront is uninstalled, either interactively or silently.
- `CitrixMsi-CitrixStoreFront-x64-*.log`—Created when StoreFront is installed and uninstalled, either interactively or silently.

StoreFront supports Windows event logging for the authentication service, stores, and Receiver for Web sites. Any events that are generated are written to the StoreFront application log, which can be viewed using Event Viewer under either Application and Services Logs > Citrix Delivery Services or Windows Logs > Application. You can control the number of duplicate log entries for a single event by editing the configuration files for the authentication service, stores, and Receiver for Web sites.

The Citrix StoreFront management console automatically records tracing information. By default, tracing for other operations is disabled and must be enabled manually. Logs created by Windows PowerShell commands are stored in the `\Admin\logs\` directory of the StoreFront installation, typically located at `C:\Program Files\Citrix\Receiver StoreFront\`. The log file names contain command actions and subjects, along with time stamps that can be used to differentiate command sequences.

Important: In multiple server deployments, use only one server at a time to make changes to the configuration of the server group. Ensure that the Citrix StoreFront management console is not running on any of the other servers in the deployment. Once complete, [propagate your configuration changes to the server group](#) so that the other servers in the deployment are updated.

### To configure log throttling

1. Use a text editor to open the `web.config` file for the authentication service, store, or Receiver for Web site, which are typically located in the `C:\inetpub\wwwroot\Citrix\Authentication\`,

C:\inetpub\wwwroot\Citrix\storename\, and C:\inetpub\wwwroot\Citrix\storenameWeb\ directories, respectively, where storename is the name specified for the store when it was created.

2. Locate the following element in the file.

```
1 <logger duplicateInterval="00:01:00" duplicateLimit="10">
2 <!--NeedCopy-->
```

By default, StoreFront is configured to limit the number of duplicate log entries to 10 per minute.

3. Change the value of the duplicateInterval attribute to set the time period in hours, minutes, and seconds over which duplicate log entries are monitored. Use the duplicateLimit attribute to set the number of duplicate entries that must be logged within the specified time interval to trigger log throttling.

When log throttling is triggered, a warning message is logged to indicate that further identical log entries will be suppressed. Once the time limit elapses, normal logging resumes and an informational message is logged indicating that duplicate log entries are no longer being suppressed.

## To enable tracing

**Caution:** The StoreFront and PowerShell consoles cannot be open at the same time. Always close the StoreFront admin console before using the PowerShell console to administer your StoreFront configuration. Likewise, close all instances of the PowerShell before opening the StoreFront console.

1. Use an account with local administrator permissions to start Windows PowerShell and, at a command prompt, type the following commands and restart the server to enable tracing.

```
1 Add-PSSnapin Citrix.DeliveryServices.Framework.Commands
2 Set-DSTraceLevel -All -TraceLevel Verbose
3 <!--NeedCopy-->
```

Allowed values for -TraceLevel are, in increasing levels of tracing detail: Off, Error, Warning, Info, Verbose.

StoreFront automatically captures Error trace messages. Due to the large amount of data that can potentially be generated, tracing may significantly impact the performance of StoreFront, so it is recommended that the Info or Verbose levels are not used unless specifically required for troubleshooting.

Optional arguments for the Set-DSTraceLevel cmdlet are:

- FileCount: Specifies the number of trace files (default = 3)
- FileSizeKb: Specifies the maximum size of each trace file (default = 1000)

-ConfigFile <FileName>: An alternative to -All that allows a specific configuration file to be updated rather than all. For example, a -ConfigFile value of c:\inetpub\wwwroot\Citrix\<StoreName>\web.conf would set tracing for the Store with the name <StoreName>.

2. To disable tracing, type the following commands and restart the server.

```
1 Add-PSSnapin Citrix.DeliveryServices.Framework.Commands
2 Set-DSTraceLevel -All -TraceLevel Off
3 <!--NeedCopy-->
```

When tracing is enabled, tracing information is written in the \Admin\Trace\ directory of the StoreFront installation located at C:\Program Files\Citrix\Receiver StoreFront\.
